Typing python in the input form at www.yahoo.com brings up the URL

1. Write a function SearchURL(s). On input is the string s we want to search for, e.g.: "python". SearchURL returns the URL in the format as above. The URL on return cannot return any spaces. Spaces in the search string s must be replaced by plus signs, e.g.: "Guido van Rossum" becomes "Guido+van+Rossum".

2. Write a function SearchYahoo(url) which takes on input the URL returned by SearchURL(s). The function opens the web page and prints the results to screen.
