### Monte Carlo for $\pi$

a pleasingly parallel computation

client/server communication with sockets

### Analogy between a telephone exchange and sockets:

- 1. dial company on 1-312-666-9000 connect to IP address 127.0.0.1
- 2. call answered by reception connection established to remote host
- 3. ask for computer center

route using specified port (8732)

4. call answered by computer center

server handles request from client

5. hang up the phone

close sockets

Monte Carlo methods: throwing darts

The area of the unit disk is  $\pi$ :

Generate random uniformly distributed points with coordinates  $(x, y) \in [-1, +1] \times [-1, +1]$ . We count a success when  $x^2 + y^2 \le 1$ .

1. generate *n* points *P* in  $[0, 1] \times [0, 1]$ 

2. 
$$m := \{ (x, y) \in P : x^2 + y^2 \le 1 \}$$

3. the estimate is then  $4 \times m/n$ 

→ dual core processor: use two clients.
pleasingly parallel: optimal speedup (twice as fast)

## Summary + Assignments

We covered more of chapter 12 in *Making Use of Python*; and introduced *interactive* parallel computation. Exercises:

- 1. Explore the possibilities of a client/server interaction between icarus.cc.uic.edu and computers in the labs, or between your laptop and home computer.
- 2. Modify the code for talk\_host.py: the user is prompted to enter the number of clients. Change the code for talk\_client.py: the user enters the number of the client. Extend the data swapping protocol: data from the *i*th client goes to the (*i* + 1)st client, data from the last client is sent to the first one.
- 3. The natural logarithm of 2 is  $\ln(2) = \int_{1}^{2} \frac{1}{x} dx$ . Adjust the code for estimating  $\pi$ , to estimate  $\ln(2)$  with an interactive parallel client/server computation.
