SymPy in SageMath

Computing expressions starts with symbols.

- Both SymPy and SageMath use var() to declare symbols.
- To use SymPy symbols in SageMath:

import sympy x = sympy.var('x')

- SymPy symbols are needed in sympy.series.
- SymPy results are cast into the Symbolic Ring with SR().

Series with a Generator

The *Taylor series* of f(x) at x = a is

$$f(a) + f'(a)(x-a) + f''(a)\frac{1}{2}(x-a)^2 + f'''(a)\frac{1}{3!}(x-a)^3 + \cdots$$

or written with the derivative operator D, up to order n

$$\sum_{k=0}^{n-1} \frac{D^k f(a)}{k!} (x-a)^k + O((x-a)^n),$$

where

- $D^k f(a)$ is the value of the *k*-th derivative of f(x) at x = a,
- $O((x a)^n)$ is the *order* of the series.

With a generator, we compute *the next term* in the series.

solving recurrence relations

Examples of a one term and two term recurrent relations are below.

• The cost T(n) of merge sort on a list of *n* numbers:

$$T(n) = 2T\left(\frac{n}{2}\right) + n - 1, \quad T(1) = 0.$$

The Fibonacci numbers, for a nonnegative integer n,

$$f(n) = f(n-1) + f(n-2), \quad f(0) = 0, \quad f(1) = 1.$$

A B F A B F

9/9

An explicit expression in function of *n* can be obtained for the solution.
