1. Read Section 4.3, 4.4 in the ESL textbook by yourself.

2. Use 5-fold cross-validation to select the most appropriate multinomial logistic regression models for the trauma clinical trial data (`trauma.txt`). You may have eight model candidates, baseline-category, cumulative, adjacent-categories, and continuation-ratio logit models with proportional odds or non-proportional odds. Note that the partition for cross-validation should be done on the 802 records of patients.
