# List coloring triangle-free hypergraphs 

Jeff Cooper * Dhruv Mubayi ${ }^{\dagger}$

February 20, 2014

#### Abstract

A triangle in a hypergraph is a collection of distinct vertices $u, v, w$ and distinct edges $e, f, g$ with $u, v \in e, v, w \in f, w, u \in g$ and $\{u, v, w\} \cap e \cap f \cap g=\emptyset$. Johansson [11] proved that every triangle-free graph with maximum degree $\Delta$ has list chromatic number $O(\Delta / \log \Delta)$. Frieze and the second author [8] proved that every linear (meaning that every two edges share at most one vertex) triangle-free triple system with maximum degree $\Delta$ has chromatic number $O(\sqrt{\Delta / \log \Delta})$. The restriction to linear triple systems was crucial to their proof.

We provide a common generalization of both these results for rank 3 hypergraphs (edges have size 2 or 3 ). Our result removes the linear restriction from [8], while reducing to the (best possible) result [11] for graphs. In addition, our result provides a positive answer to a restricted version of a question of Ajtai, Erdős, Komlós, and Szemerédi [1] concerning sparse 3-uniform hypergraphs.

As an application, we prove that if $\mathcal{C}_{3}$ is the collection of 3-uniform triangles, then the Ramsey number $R\left(\mathcal{C}_{3}, K_{t}^{3}\right)$ satisfies $$
\frac{a t^{3 / 2}}{(\log t)^{3 / 4}} \leq R\left(\mathcal{C}_{3}, K_{t}^{3}\right) \leq \frac{b t^{3 / 2}}{(\log t)^{1 / 2}}
$$ for some positive constants $a$ and $b$. The upper bound makes progress towards the recent conjecture of Kostochka, the second author, and Verstraëte [14] that $R\left(C_{3}, K_{t}^{3}\right)=o\left(t^{3 / 2}\right)$ where $C_{3}$ is the linear triangle.

## 1 Introduction

A hypergraph $H=(V, E)$ is a tuple consisting of a set of vertices $V$ and a set of edges $E$, which are subsets of $V$. The hypergraph has rank $k$ if every edge contains at most $k$ vertices and is called $k$-uniform if every edge contains exactly $k$ vertices. A proper coloring of $H$ is an assignment of colors to the vertices so that no edge is monochromatic. The chromatic number of $H, \chi(H)$, is the minimum number of colors needed in a proper coloring of $H$.

The chromatic number of graphs (2-uniform hypergraphs) has been studied extensively. A greedy coloring algorithm can be used to show that for any graph $G$ with maximum degree $\Delta$, $\chi(G) \leq \Delta+1$; this bound is tight for complete graphs and odd cycles. Brooks [5] extended this by showing that if $G$ is not a complete graph or an odd cycle, then $\chi(G) \leq \Delta$.

A natural question to ask is what other structural properties can be put on a graph to decrease its chromatic number. One approach is to fix a graph $K$ and consider the family of graphs which contain no copy of $K$. For example, if $K$ is a tree on $e$ edges and $G$ contains no copy of $K$, then $\chi(G) \leq e$; this follows from the fact that if $G$ contains no copy of $K$, then $G$ contains a vertex of degree at most $e-1$ (see [21], pg. 70).

When $K$ is a cycle, the problem becomes more difficult. Kim [12] showed that if $G$ contains no 4 -cycles or 3 -cycles, then $\chi(G) \leq(1+o(1)) \Delta / \log \Delta$ as $\Delta \rightarrow \infty$, which is within a factor of 2 of the best possible bound. Shortly after, Johansson [11] showed that if $G$ contains no 3 -cycles, then $\chi(G)=O(\Delta / \log \Delta)$. Using Johansson's result, Alon, Krivelevich, and Sudakov [3] showed that if $K$ is any graph containing a vertex $x$ such that $K-x$ is bipartite, then $\chi(G)=O(\Delta / \log \Delta)$.

Some analogous results for hypergraphs are known. Using the local lemma, one can show that $\chi(H)=O\left(\Delta^{1 /(k-1)}\right)$ for any $k$-uniform hypergraph $H$. Bohman, Frieze, and the second author [4] showed that if $K$ is a fixed $k$-uniform hypertree on $e$ edges and $H$ is a $k$-uniform hypergraph containing no copy of $K$, then $\chi(H) \leq 2(k-1)(e-1)+1$; Loh [15] improved this to $\chi(H) \leq e$, matching the result for graphs.

A hypergraph is linear (or contains no 2-cycles) if any two of its edges intersect in at most one vertex. A triangle in a linear hypergraph is a set of three pairwise intersecting edges with no common point. In [8], Frieze and the second author showed that if $H$ is a 3-uniform, linear, triangle-free hypergraph, then $\chi(H)=O(\sqrt{\Delta} / \sqrt{\log \Delta})$. They subsequently removed the triangle-free condition and generalized their result from 3 to $k$, showing that $\chi(H)=O\left((\Delta / \log \Delta)^{1 /(k-1)}\right)$ for any $k$-uniform, linear hypergraph $H$ [9]. As shown in [4], these results are tight apart from the implied constants.

### 1.1 Our Result

Our contribution is to remove the linear condition from [8]. However, in doing so, we also widen the definition of a triangle.

Definition 1. A triangle in a hypergraph $H$ is a set of three distinct edges $e, f, g \in H$ and three distinct vertices $u, v, w \in V(H)$ such that $u, v \in e, v, w \in f, w, u \in g$ and $\{u, v, w\} \cap e \cap f \cap g=\emptyset$.

For example, the three triangles in a 3-uniform hypergraph are the loose triangle $C_{3}=$ $\{a b c, c d e, e f a\}, F_{5}=\{a b c, b c d, a e d\}$, and $K_{4}^{-}=\{a b c, b c d, a b d\}$.

Given a set $L(v)$ of colors for every vertex $v \in V(H)$, a proper list coloring of $H$ is a proper coloring where every vertex $v$ receives a color from $L(v)$. The list chromatic number of $H, \chi_{l}(H)$, is the minimum $l$ so that if $|L(v)| \geq l$ for all $v$, then $H$ has a proper list coloring. It is not hard to see that $\chi(H) \leq \chi_{l}(H)$. As in [12] and [11], our main theorem can be stated in terms of list chromatic number. If $H$ is a rank $k$ hypergraph and $i \leq k$, the $i$-degree of a vertex $v$ is the number of size $i$ edges containing $v$.

Theorem 2. Suppose $H$ is a rank 3, triangle-free hypergraph with maximum 3 -degree $\Delta$ and maximum 2 -degree $\Delta_{2}$. Then

$$
\chi_{l}(H) \leq c_{1} \max \left\{\left(\frac{\Delta}{\log \Delta}\right)^{\frac{1}{2}}, \frac{\Delta_{2}}{\log \Delta_{2}}\right\}
$$

for some constant $c_{1}$.

Theorem 2 generalizes the results of [11] and [8]. Additionally, it strengthens [8] by removing the linear hypothesis, which was a crucial ingredient in the proof. We prove Theorem 2 by using a semi-random algorithm to properly color the hypergraph. Our algorithm is similar to the algorithm in [8], however, several new ideas are developed to deal with the non-linear case.

As mentioned above, for $n$-vertex 3 -uniform hypergraphs $H$ with maximum degree $\Delta$, one can easily show that the independence number of $H$ is $\Omega(n / \sqrt{\Delta})$ and $\chi(H)=$ $O(\sqrt{ } \Delta)$. However, adding a local restriction to the hypergraph in order to significantly improve either of these bounds is a more complicated problem for hypergraphs than for graphs. Ajtai, Erdős, Komlós, and Szemerédi [1] showed that if $F$ is any fixed graph and $G$ is an $F$-free, $n$-vertex graph with maximum degree $\Delta$, then $G$ has independence number at least $c_{F} \frac{n}{\Delta} \log \log \Delta$, for some fixed constant $c_{F}$. Shearer [19] later improved the $\log \log \Delta$ factor to $\frac{\log \Delta}{\log \log \Delta}$. Ajtai et. al asked if the lower bound $\Omega(n / \sqrt{\Delta})$ can be improved for 3 -uniform, $K_{4}^{-}$-free hypergraphs. The authors [6] recently constructed

3 -uniform, $K_{4}^{-}$-free hypergraphs with independence number $O(n / \sqrt{\Delta})$, negatively answering the question of Ajtai et. al. On the other hand, Theorem 2 provides a positive answer to their question for hypergraphs which are also $C_{3}$ and $F_{5}$ free. The question of whether or not Theorem 2 can be extended to the larger classes of $C_{3}$-free or $F_{5}$-free hypergraphs remains open.

### 1.2 Application to Hypergraph Ramsey Numbers

Let $\mathcal{C}_{3}^{r}$ be the collection of $r$-uniform hypergraph triangles. Notice that for graphs, $C_{3}^{2}$ consists of only the 3 -vertex cycle, and for triple systems, $\mathcal{C}_{3}^{3}=\left\{C_{3}, F_{5}, K_{4}^{-}\right\}$. The hypergraph Ramsey number $R\left(\mathcal{C}_{3}^{r}, K_{t}^{r}\right)$ is the smallest $n$ so that in every red-blue coloring of the edges of the complete $r$-uniform hypergraph $K_{n}^{r}$, there exists a red triangle or a blue $K_{t}^{r}$. Ajtai-Komlós-Szemerédi [2] and Kim [13] proved that $R\left(\mathcal{C}_{3}^{2}, K_{t}^{2}\right)=\Theta\left(t^{2} / \log t\right)$.

In [14], Kostochka, the second author, and Verstraëte proved a version of this result for $r=3$. In this setting, $R\left(C_{3}, K_{t}^{3}\right)$ is the smallest $n$ so that in every red-blue coloring of the edges of the complete 3-uniform hypergraph $K_{n}^{3}$, there exists a red $C_{3}$ or a blue $K_{t}^{3}$. [14] showed that there exist constants $a, b$ such that

$$
\frac{a t^{3 / 2}}{(\log t)^{3 / 4}} \leq R\left(C_{3}, K_{t}^{3}\right) \leq b t^{3 / 2}
$$

and they conjectured that the upper bound could be reduced to $o\left(t^{3 / 2}\right)$. In proving the upper bound, they showed that if $H$ is a 3 -uniform, $C_{3}$-free hypergraph with $n$ vertices and average degree $d \geq n^{2 / 3} / 12$, then $\alpha(H) \geq d / 18$. Our result implies that any 3 uniform, $\mathcal{C}_{3}$-free hypergraph $H$ with $n$ vertices and average degree $d$ satisfies $\alpha(H)=$ $\Omega\left(\frac{n}{d^{1 / 2}} \log ^{1 / 2} d\right)$. Setting $d=n^{2 / 3} \log ^{1 / 3} n$, we obtain $R\left(\mathcal{C}_{3}^{3}, K_{t}^{3}\right)=O\left(t^{3 / 2} / \sqrt{\log t}\right)$. Since the $C_{3}$-free construction given in [14] is also $F_{5}$ and $K_{4}^{-}$free, this implies that for some constants $a$ and $b$,

$$
\frac{a t^{3 / 2}}{(\log t)^{3 / 4}} \leq R\left(\mathcal{C}_{3}^{3}, K_{t}^{3}\right) \leq b \frac{t^{3 / 2}}{(\log t)^{1 / 2}}
$$

### 1.3 Organization

In Section 2, we present the probabilistic tools we will need to analyze our algorithm. In Section 3, we describe our algorithm. The presentation is similar to Vu's description in [20] of Johansson's algorithm. Section 4 contains an analysis of our algorithm. This analysis does not use triangle-free anywhere, but is instead based on parameters which can be given to the algorithm. In Section 5, we show how triangle-free can be used to set these parameters in a way that implies Theorem 2.

## 2 Tools

### 2.1 Local Lemma

Asymmetric Local Lemma ([18]). Consider a set $\mathcal{E}=\left\{A_{1}, \ldots, A_{n}\right\}$ of (typically bad) events such that each $A_{i}$ is mutually independent of $\mathcal{E}-\left(\mathcal{D}_{i} \cup A_{i}\right)$, for some $\mathcal{D}_{i} \subset \mathcal{E}$. If for each $1 \leq i \leq n$

- $\operatorname{Pr}\left[A_{i}\right] \leq 1 / 4$, and
- $\sum_{A_{j} \in \mathcal{D}_{i}} \operatorname{Pr}\left[A_{j}\right] \leq 1 / 4$,
then with positive probability, none of the events in $\mathcal{E}$ occur.

### 2.2 Concentration Theorems

The first result is due to Hoeffding [10].
Theorem 3. Suppose that $X=X_{1}+\cdots+X_{m}$, where the $X_{i}$ are independent random variables satisfying $\left|X_{i}\right| \leq a_{i}$ for all $i$. Then for any $t>0$,

$$
\operatorname{Pr}[X \geq \mathbf{E}[X]+t] \leq e^{-\frac{2 t^{2}}{\sum_{i=1}^{2} a_{i}^{2}}}
$$

and

$$
\operatorname{Pr}[X \leq \mathbf{E}[X]-t] \leq e^{-\frac{2 t^{2}}{\sum_{i=1}^{t_{i}^{2}}}}
$$

We will also use the following theorem, which is Theorem 2.7 from [17].
Theorem 4. Suppose that $X=X_{1}+\cdots+X_{m}$, where the $X_{i}$ are independent random variables satisfying $X_{i} \leq \mathbf{E}\left[X_{i}\right]+b$ for all $i$. Then for any $t>0$,

$$
\operatorname{Pr}[X \geq \mathbf{E}[X]+t] \leq e^{-\frac{t^{2}}{2 \operatorname{Var}[X]+b t}}
$$

McDiarmid [16] proved the following generalization of Theorem 3.
Theorem 5. Let $Z_{1}, \ldots, Z_{n}$ be independent random variables, with $Z_{i}$ taking values in a set $\mathcal{A}_{i}$ for each $i$. Suppose that the (measurable) function $g: \prod \mathcal{A}_{k} \rightarrow \mathbb{R}$ satisfies $\left|g(x)-g\left(x^{\prime}\right)\right| \leq d_{i}$ whenever the vectors $x$ and $x^{\prime}$ differ only in the $i^{\text {th }}$ coordinate. Let $W$ be the random variable $g\left(Z_{1}, \ldots, Z_{n}\right)$. Then for any $t>0$,

$$
\operatorname{Pr}[W>\mathbf{E}[W]+t] \leq e^{-2 t^{2} / \sum_{i=1}^{n} d_{i}^{2}} .
$$

Note that in the above theorem, we may view $\prod \mathcal{A}_{k}$ as a probability space induced by the random variables $Z_{1}, \ldots, Z_{n}$. We will use the following corollary, which resembles Theorem 7.2 from [7].

Corollary 6. Let $X_{1}, \ldots, X_{n}$ be independent random variables, with $X_{i}$ taking values in a set $\mathcal{B}_{i}$ for each $i$. Let $\mathcal{A}_{1}, \ldots, \mathcal{A}_{n}$ be events, where each $\mathcal{A}_{i} \subset \mathcal{B}_{i}$. Set $\mathcal{A}=\prod_{i=1}^{n} \mathcal{A}_{i}$. Suppose that the (measurable) function $f: \prod \mathcal{B}_{k} \rightarrow \mathbb{R}$ is non-negative and satisfies $\left|f(x)-f\left(x^{\prime}\right)\right| \leq d_{i}$ for any two vectors $x, x^{\prime} \in \mathcal{A}$ differing only in the $i^{\text {th }}$ coordinate. Let $Y$ be the random variable $f\left(X_{1}, \ldots, X_{n}\right)$. Then

$$
\operatorname{Pr}[Y>\mathbf{E}[Y] / \operatorname{Pr}[\mathcal{A}]+t] \leq e^{-2 t^{2} / \sum_{i=1}^{n} d_{i}^{2}}+\operatorname{Pr}[\overline{\mathcal{A}}] .
$$

Proof. Define $g: \mathcal{A} \rightarrow \mathbb{R}$ by $g(x):=f(x)$ (in other words, $g=f \mid \mathcal{A}$ ). For each $i$, let $Z_{i}: X_{i}^{-1}\left(\mathcal{A}_{i}\right) \rightarrow \mathcal{A}_{i}$ be the random variable with $Z_{i}(s)=X_{i}(s)$ for all $s \in X_{i}^{-1}\left(\mathcal{A}_{i}\right)$. Let $W$ be the random variable $g\left(Z_{1}, \ldots, Z_{n}\right)$. Since the $X_{i}$ are independent, the $Z_{i}$ are also independent, so we will be able to apply Theorem 5 to bound $\operatorname{Pr}[W>\mathbf{E}[W]+t]$.

By total probability and the non-negativity of $f$,

$$
\mathbf{E}[Y]=\mathbf{E}[Y \mid \mathcal{A}] \operatorname{Pr}[\mathcal{A}]+\mathbf{E}[Y \mid \overline{\mathcal{A}}] \operatorname{Pr}[\overline{\mathcal{A}}] \geq \mathbf{E}[Y \mid \mathcal{A}] \operatorname{Pr}[\mathcal{A}]
$$

so

$$
\mathbf{E}[W]=\mathbf{E}[Y \mid \mathcal{A}] \leq \mathbf{E}[Y] / \operatorname{Pr}[\mathcal{A}] .
$$

Combining this with Theorem 5 implies

$$
\begin{aligned}
\operatorname{Pr}\left[Y>\frac{\mathbf{E}[Y]}{\operatorname{Pr}[\mathcal{A}]}+t\right] & =\operatorname{Pr}\left[\left.Y>\frac{\mathbf{E}[Y]}{\operatorname{Pr}[\mathcal{A}]}+t \right\rvert\, \mathcal{A}\right] \operatorname{Pr}[\mathcal{A}]+\operatorname{Pr}\left[\left.Y>\frac{\mathbf{E}[Y]}{\operatorname{Pr}[\mathcal{A}]}+t \right\rvert\, \overline{\mathcal{A}}\right] \operatorname{Pr}[\overline{\mathcal{A}}] \\
& \leq \operatorname{Pr}\left[\left.Y>\frac{\mathbf{E}[Y]}{\operatorname{Pr}[\mathcal{A}]}+t \right\rvert\, \mathcal{A}\right]+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& \leq \operatorname{Pr}[Y>\mathbf{E}[Y \mid \mathcal{A}]+t \mid \mathcal{A}]+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& =\operatorname{Pr}[W>\mathbf{E}[W]+t]+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& \leq e^{-2 t^{2} / \sum_{i=1}^{n} d_{i}^{2}}+\operatorname{Pr}[\overline{\mathcal{A}}]
\end{aligned}
$$

## 3 Coloring Algorithm

The input to our algorithm is a rank 3 hypergraph with maximum 3-degree $\Delta$ and maximum 2-degree $\Delta_{2}$. Let $H$ denote the input hypergraph restricted to its size 3 edges, and let $G$ denote the input hypergraph restricted to its size 2 edges. At the
beginning, each vertex $u$ has a list $C(u)$ of acceptable colors. We assume $|C(u)|=C$ for all vertices $u$. For each vertex $u$ and color $c$, we set

$$
p_{u}^{0}(c)= \begin{cases}1 / C, & \text { if } c \in C(u) \\ 0, & \text { if } c \notin C(u)\end{cases}
$$

We define a parameter $\hat{p}$, which will serve as an upper bound on the weights $p_{u}^{i}(c)$. Set $W^{0}(u)=\left\{p_{u}^{0}(c): c \in \cup_{v} C(v)\right\}$. We start with the hypergraph $H^{0}=H$ and the collection $\left\{W^{0}(u)\right\}_{u}$. For each color $c$, we also construct a graph $G_{c}^{0}$, which is initially a copy of the 2 -graph $G$. Finally, we assign to each vertex an empty set $B^{0}(u)$.

At the $(i+1)^{\text {th }}$ step, $i=0,1, \ldots, T-1$, our input to the algorithm is a quadruple, $\left(H^{i},\left\{G_{c}^{i}\right\}_{c},\left\{W_{u}^{i}\right\}_{u},\left\{B^{i}(u)\right\}_{u}\right)$. We generate a small random set of colors at each vertex $u$ as follows: For each color $c$, we choose $c$ with probability $\theta p_{u}^{i}(c)$. Let

$$
\gamma_{u}^{i}(c)= \begin{cases}1, & \text { if } c \text { is chosen at } u \\ 0, & \text { otherwise }\end{cases}
$$

Note that the $\gamma_{u}^{i}(c)$ are independent random variables.
Consider a vertex $u$. We define the set of colors lost at $u$ as

$$
L^{i}(u)=\left\{c: \exists e \in E\left(H^{i}\right) \cup E\left(G_{c}^{i}\right) \text { such that } u \in e \text { and } \gamma_{v}^{i}(c)=1 \forall v \in e-u\right\}
$$

We say a color $c$ survives at $u$ if $c \notin B^{i}(u)$ and $c \notin L^{i}(u)$. For $c \notin B^{i}(u)$, we define

$$
\begin{equation*}
q_{u}^{i}(c):=\operatorname{Pr}[c \text { survives at } u]=\operatorname{Pr}\left[\bigcap_{\substack{\{v, w\}: \\ u v w \in H^{i}}}\left(\gamma_{v}^{i}(c)=0 \cup \gamma_{w}^{i}(c)=0\right) \bigcap_{v: u v \in G_{c}^{i}} \gamma_{v}^{i}(c)=0\right] . \tag{3.1}
\end{equation*}
$$

In other words, if $c \notin B^{i}(u)$, then $q_{u}^{i}(c)=\operatorname{Pr}\left[c \notin L^{i}(u)\right]$. Note that at the $(i+1)^{t h}$ step, $q_{u}^{i}(c)$ is a fixed number, which can be computed given $H^{i}, G_{c}^{i}$, and all of the $p_{v}^{i}(c)$; it does not depend on the random variables $\gamma_{u}^{i}(c)$. In the analysis below, we will use the bound

$$
\begin{align*}
q_{u}^{i}(c) & =1-\operatorname{Pr}\left[\bigcup_{u v w \in H^{i}}\left(\gamma_{v}^{i}(c)=1 \cap \gamma_{w}^{i}(c)=1\right) \bigcup_{u v \in G_{c}^{i}} \gamma_{v}(c)=1\right] \\
& \geq 1-\sum_{u v w \in H^{i}} \theta^{2} p_{v}^{i}(c) p_{w}^{i}(c)-\sum_{u v \in G_{c}^{i}} \theta p_{v}^{i}(c) \tag{3.2}
\end{align*}
$$

Let $\mathbf{I}[X]$ denote the 0,1 indicator variable for the event $X$. Define $p_{u}^{i+1}(c)$ as:

- If $p_{u}^{i}(c) / q_{u}^{i}(c)<\hat{p}$ and $c \notin B^{i}(u)$, then

$$
p_{u}^{i+1}(c)=p_{u}^{i}(c) \frac{\mathbf{I}[c \text { survives at } u]}{\operatorname{Pr}[c \text { survives at } u]}= \begin{cases}p_{u}^{i}(c) / q_{u}^{i}(c), & \text { if } c \text { survives at } u,  \tag{3.3}\\ 0, & \text { else. }\end{cases}
$$

- If $p_{u}^{i}(c) / q_{u}^{i}(c) \geq \hat{p}$ or $c \in B^{i}(u)$, then we toss a biased coin with $\operatorname{Pr}[H e a d]=$ $p_{u}^{i}(c) / \hat{p}$. We then set

$$
\eta_{u}^{i}(c)=\mathbf{I}[\text { Head }],
$$

and

$$
p_{u}^{i+1}(c)=p_{u}^{i}(c) \frac{\mathbf{I}[\text { Head }]}{\operatorname{Pr}[\text { Head }]}= \begin{cases}\hat{p}, & \text { if } \eta_{u}^{i}(c)=1  \tag{3.4}\\ 0, & \text { else } .\end{cases}
$$

Crucially, (3.3) and (3.4) imply

$$
\begin{equation*}
\mathbf{E}\left[p_{u}^{i+1}(c)\right]=p_{u}^{i}(c) . \tag{3.5}
\end{equation*}
$$

Color $u$ with $c$ if $c$ survives at $u$ and $\gamma_{u}^{i}(c)=1$ (if there are multiple such $c$, pick one arbitrarily). Let $U^{i+1}$ denote the set of uncolored vertices in $H$ after the iteration $i$. Let $H^{i+1}$ be the hypergraph induced from $H$ by $U^{i+1}$, let $B^{i+1}(u)=\left\{c: p_{u}^{i+1}(c)=\hat{p}\right\}$, and let $W_{u}^{i+1}=\left\{p_{u}^{i+1}(c)\right\}$. To form $G_{c}^{i+1}$, start with $G_{c}^{i}$, and for each triple $u, v, w \in U^{i}$ with $u, v \in U^{i+1}, u v \notin G_{c}^{i}$, and $w$ colored $c$, add an edge $u v$ to $G_{c}^{i+1}$. Then delete any vertex from $G_{c}^{i+1}$ that is not in $U^{i+1}$.

Observe that if $u v w$ is an edge in $H^{i}$ and $u$ and $v$ are both colored $c$ in the current round, then $p_{w}^{i+1}(c) \in\{0, \hat{p}\}$; in particular, $c$ is never considered for $w$ in a future round. Similarly, if $v w \in G_{c}^{i}$ and $v$ is colored with $c$ in the current round, then $c$ is never considered for $w$ in the future. Thus the algorithm always maintains a proper partial coloring of $H$.

After $T$ iterations, some vertices will remain uncolored. We color these in one final step, which is described in Section 4.5.

### 3.1 Parameters and Notation

We summarize all of the variables used in the algorithm and its analysis in the two tables below. The first table contains descriptions of the independent variables in our algorithm. We set them for one family of hypergraphs in Section 5, when we prove that our algorithm works for triangle-free hypergraphs. The values of the remaining parameters are defined in the second table.

Our algorithm requires that the parameter $\omega_{0}$ satisfy the following properties:

- For any edge $u v w \in H^{i}$ and any color $c$,

$$
\begin{equation*}
\operatorname{Pr}\left[c \notin L^{i}(u) \cup L^{i}(v) \cup L^{i}(w)\right] \leq q_{u}^{i}(c) q_{v}^{i}(c) q_{w}^{i}(c)\left(1+1 / \omega_{0}\right) \tag{3.6}
\end{equation*}
$$

- For any color $c$ and any pair $u, v$ with an edge $u v w \in H^{i}$ for some $w$,

$$
\begin{equation*}
\operatorname{Pr}\left[c \notin L^{i}(u) \cup L^{i}(v)\right] \leq q_{u}^{i}(c) q_{v}^{i}(c)\left(1+1 / \omega_{0}\right) . \tag{3.7}
\end{equation*}
$$

- For any color $c$ and any edge $u v \in G_{c}^{i}$,

$$
\begin{equation*}
\operatorname{Pr}\left[c \notin L^{i}(u) \cup L^{i}(v)\right] \leq q_{u}^{i}(c) q_{v}^{i}(c)\left(1+1 / \omega_{0}\right) . \tag{3.8}
\end{equation*}
$$

Description
$\Delta \quad$ Maximum degree of 3 -graph
$\Delta_{2}$ Maximum degree of 2-graph
$\delta$ Maximum codegree
$\omega$ Color bound, tending to $\infty$ with $\Delta$
$\epsilon \quad$ Small constant
$\omega_{0} \quad$ Error term depending on $H$
$\hat{p} \quad$ Threshold probability

|  | Value | Description |
| :--- | :--- | :--- |
| $C$ | $\sqrt{\Delta} / \sqrt{\omega}$ | Number of colors |
| $T$ | $(5 \omega / \epsilon) \log \omega$ | Number of iterations |
| $\theta$ | $\epsilon / \omega$ | Activation probability |
| $m$ | 21 | Used to control codegrees |

We will use the following notation:

$$
\begin{aligned}
N_{H}^{i}(u) & =\left\{v \in V\left(H^{i}\right)-u: \exists e \in H^{i} \text { with } u, v \in e\right\} \\
N_{H}^{i}(u, v) & =\left\{w \in V\left(H^{i}\right)-\{u, v\}:\{u, v, w\} \in H^{i}\right\} \\
N_{c}^{i}(u) & =\left\{v \in V\left(G_{c}^{i}\right)-u: \exists e \in G_{c}^{i} \text { with } u, v \in e\right\} \\
N^{i}(u) & =N_{H}^{i}(u) \cup \cup_{c} N_{c}^{i}(u) \\
N_{G}^{0}(u) & =\{v \in V(G): u v \in E(G)\} \\
d_{H}^{i}(u) & =\left|\left\{e \in H^{i}: u \in e\right\}\right| \\
d_{H}^{i}(u, v) & =\left|\left\{e \in H^{i}: u, v \in e\right\}\right| \\
d_{G_{c}}^{i}(u) & =\left|\left\{v \in G_{c}^{i}: u v \in G_{c}\right\}\right| .
\end{aligned}
$$

At the beginning of iteration $i$ of the algorithm, we also define the following parameters:

$$
\begin{aligned}
w\left(p_{u}^{i}\right) & =\sum_{c \in C(u)} p_{u}^{i}(c) \\
f_{u}^{i}(c) & =\sum_{v: u v \in G_{c}^{i}} p_{v}^{i}(c)
\end{aligned}
$$

$$
\begin{aligned}
f_{u}^{i} & =\sum_{c \in C(u)} \sum_{v: u v \in G_{c}^{i}} p_{u}^{i}(c) p_{v}^{i}(c) \\
e_{u v w}^{i} & =\sum_{c \in C(u)} p_{u}^{i}(c) p_{v}^{i}(c) p_{w}^{i}(c) \\
e_{u}^{i} & =\sum_{\{v, w\}: u v w \in H^{i}} e_{u v w}^{i} \\
e_{u}^{i}(c) & =\sum_{\{v, w\}: u v w \in H^{i}} p_{v}^{i}(c) p_{w}^{i}(c) \\
h_{u}^{i} & =-\sum_{c \in C(u)} p_{u}^{i}(c) \log p_{u}^{i}(c), \text { where } x \log x:=0 \text { if } x=0 .
\end{aligned}
$$

Our analysis assumes that the parameters of the algorithm satisfy the following relations. All asymptotic notation assumes $\Delta \rightarrow \infty$.
(R1) $\theta \log (\hat{p} C) \geq 149$
(R2) $\omega=\Delta^{o(1)}$.
(R3) $\omega_{0}>\omega^{4}$
(R4) $\epsilon \leq 1 / 72$
(R5) $\delta \leq \Delta^{6 / 10}$
(R6) $\Delta_{2} \leq \sqrt{\Delta} \sqrt{\omega}$
(R7) $\Delta^{-1 / 2} \leq \hat{p} \leq \Delta^{-11 / 24}$.

The analysis in Section 4 only requires that (3.6), (3.7), (3.8), and (R1)-(R7) hold; the parameters $\omega, \epsilon, \hat{p}$, and $\omega_{0}$ depend on the structure of the hypergraph. For instance, we will use the following bounds when applying the analysis to triangle-free hypergraphs:

$$
\epsilon=1 / 72 \quad \omega=(1 / 24)(\epsilon / 150) \log \Delta \quad \hat{p}=\Delta^{-11 / 24} \quad \omega_{0}=1 / 19 \theta \hat{p}
$$

## 4 Analysis of Algorithm

Theorem 7. If (3.6), (3.7), (3.8), and (R1)-(R7) hold and $|C(u)| \leq C$ for all vertices $u$, then the algorithm produces a proper list coloring of $H \cup G$.

Proof. By Lemma 8, our algorithm proceeds for $T$ iterations, coloring most of the vertices. Since Lemmas 8, 9 and 11 hold after iteration $T$, we may color the remaining vertices as described in Section 4.5.

Lemma 8 (Main Lemma). If (3.6), (3.7), (3.8), and (R1)-(R7) hold, then for each $i=0,1, \ldots T$, the following properties hold:
(P1) $\left|1-w\left(p_{u}^{i}\right)\right| \leq i /(T \log C)$.
(P2) $e_{u}^{i} \leq(1-\theta / 3)^{i} \omega+i / \omega^{2}$
(P3) $f_{u}^{i} \leq 16(1-\theta / 4)^{i} \omega$
(P4) $h_{u}^{i} \geq h_{u}^{0}-37 \epsilon \sum_{j=0}^{i-1}(1-\theta / 4)^{j}$
(P5) $d_{H}^{i}(u) \leq(1-\theta / 3)^{i} \Delta$
(P6) $d_{G_{c}}^{i}(u) \leq 3 i \theta \Delta^{5 / 4} \hat{p}$.

The proof of the Main Lemma relies on the next three lemmas.
Lemma 9. For any $i=0,1, \ldots T-1$, if (3.6), (3.7), (3.8), and (R1)-(R7) hold and $\left|B^{i}(u)\right| \leq \epsilon / \hat{p}$ for all $u \in U^{i}$, then there is an assignment of colors to the vertices in $U^{i}$ so that the following properties hold:
(Q1) $\left|w\left(p_{u}^{i+1}\right)-w\left(p_{u}^{i}\right)\right| \leq 1 /(T \log C)$
(Q2) $e_{\text {uvw }}^{i+1} \leq e_{\text {uvw }}^{i}+1 /\left(\Delta \omega^{2}\right)$
(Q3) $f_{u}^{i+1} \leq f_{u}^{i}(1-\theta / 2)+3 \theta e_{u}^{i}+1 / \omega^{2}$
(Q4) $h_{u}^{i}-h_{u}^{i+1} \leq 2 \theta\left(f_{u}^{i}+e_{u}^{i}\right)+1 / \omega^{2}$
(Q5) $d_{H}^{i+1}(u) \leq(1-\theta / 2) d_{H}^{i}(u)+\Delta^{19 / 20}$
(Q6) $d_{G_{c}}^{i+1}(u) \leq d_{G_{c}}^{i}(u)+2 \theta \Delta^{5 / 4} \hat{p}$.
Lemma 10. If (Q1)-(Q6) hold for $i$ and (P1)-(P6) hold for $i$, then (P1)-(P6) hold for $i+1$.

Lemma 11. If (P1)-(P6) hold for $i+1$ and (R1) holds, then $\left|B^{i+1}(u)\right| \leq \epsilon / \hat{p}$.

### 4.1 Proof of Main Lemma

The proof relies on Lemmas 9, 10 and 11. Assuming these lemmas, we proceed inductively as follows: properties (P1)-(P6) hold for $i=0$ ((P3) holds by (R6)). Assume (P1)-(P6) hold for $i$. By Lemma 11, $\left|B^{i}(u)\right| \leq \epsilon / \hat{p}$, so by Lemma 9, (Q1)-(Q6) hold for $i$. Thus Lemma 10 implies (P1)-(P6) hold for $i+1$.

### 4.2 Proof of Lemma 10

Proof of (P1). By (P1) (for $i$ ) and (Q1),

$$
\begin{aligned}
\left|1-w\left(p_{u}^{i+1}\right)\right| & =\left|1-w\left(p_{u}^{i}\right)+w\left(p_{u}^{i}\right)-w\left(p_{u}^{i+1}\right)\right| \\
& \leq\left|1-w\left(p_{u}^{i}\right)\right|+\left|w\left(p_{u}^{i+1}\right)-w\left(p_{u}^{i}\right)\right| \\
& \leq(i+1) /(T \log C) .
\end{aligned}
$$

Proof of (P5). Recall that (see [21], pg. 434)

$$
(1-p)^{n} \rightarrow e^{-p n} \text { if } p^{2} n \rightarrow 0 \text { as } n \rightarrow \infty
$$

Since $\theta^{2} T=o(1)$,

$$
\begin{equation*}
(\theta \Delta / 6)(1-\theta / 3)^{T} \rightarrow(\theta \Delta / 6) e^{-T \theta / 3}=(\theta \Delta / 6) e^{-\frac{5}{3} \log \omega}>\Delta^{19 / 20} \tag{4.1}
\end{equation*}
$$

Using (P5) (for $i$ ),

$$
\begin{aligned}
& d_{H}^{i+1}(u) \stackrel{\left(Q_{5}\right)}{\leq}(1-\theta / 2) d_{H}^{i}(u)+\Delta^{19 / 20} \stackrel{(\mathrm{P} 5)}{\leq}(1-\theta / 2)(1-\theta / 3)^{i} \Delta+\Delta^{19 / 20} \\
&=(1-\theta / 3)^{i+1} \Delta-\frac{\theta}{6}(1-\theta / 3)^{i} \Delta+\Delta^{19 / 20} \\
& \leq(1-\theta / 3)^{i+1} \Delta-\frac{\theta}{6}(1-\theta / 3)^{T} \Delta+\Delta^{19 / 20} \\
& \stackrel{(4.1)}{<}(1-\theta / 3)^{i+1} \Delta .
\end{aligned}
$$

Proof of (P2). By (Q2),

$$
e_{u v w}^{i+1} \leq e_{u v w}^{0}+(i+1) / \Delta \omega^{2} \leq C\left(1 / C^{3}\right)+(i+1) / \Delta \omega^{2}=\omega / \Delta+(i+1) / \Delta \omega^{2} .
$$

So by (P5) (for $i+1$ ),

$$
e_{u}^{i+1}=\sum_{u v w} e_{u v w}^{i+1} \leq(1-\theta / 3)^{i+1} \Delta\left(\omega / \Delta+(i+1) / \Delta \omega^{2}\right) \leq(1-\theta / 3)^{i+1} \omega+(i+1) / \omega^{2} .
$$

Proof of (P3). Since $\theta^{2} T=o(1)$,

$$
\begin{equation*}
\theta \omega(1-\theta / 4)^{T} \rightarrow \theta \omega e^{-\theta T / 4}=\epsilon e^{-\frac{5}{4} \log \omega}=\epsilon \omega^{-5 / 4}>3(\theta T+1 / 3) \omega^{2} . \tag{4.2}
\end{equation*}
$$

Using this with (P3) and (P2) (for $i$ ),

$$
\begin{aligned}
& f_{u}^{i+1} \stackrel{(\mathrm{Q} 3)}{\leq} f_{u}^{i}(1-\theta / 2)+3 \theta e_{u}^{i}+1 / \omega^{2} \\
& \quad \stackrel{(\mathrm{P} 3)}{\leq} 16(1-\theta / 4)^{i} \omega(1-\theta / 2)+3 \theta e_{u}^{i}+1 / \omega^{2} \\
& \quad \stackrel{(\mathrm{P} 2)}{\leq} 16(1-\theta / 4)^{i} \omega(1-\theta / 2)+3 \theta \omega(1-\theta / 3)^{i}+3 \theta T / \omega^{2}+1 / \omega^{2}
\end{aligned}
$$

$$
\begin{aligned}
& =16(1-\theta / 4)^{i} \omega(1-\theta / 4-\theta / 4)+\theta \omega(1-\theta / 3)^{i}+3(\theta T+1 / 3) / \omega^{2} \\
& =16(1-\theta / 4)^{i+1} \omega-4 \theta \omega(1-\theta / 4)^{i}+\theta \omega(1-\theta / 3)^{i}+3(\theta T+1 / 3) / \omega^{2} \\
& <16(1-\theta / 4)^{i+1} \omega-\theta \omega(1-\theta / 4)^{i}+3(\theta T+1 / 3) / \omega^{2} \\
& \stackrel{(4.2)}{<} 16(1-\theta / 4)^{i+1} \omega .
\end{aligned}
$$

Proof of (P4). Again using $\theta^{2} T=o(1)$,

$$
\begin{equation*}
\omega(1-\theta / 4)^{i} \geq \omega(1-\theta / 4)^{T} \rightarrow \omega e^{-\theta T / 4}=\omega^{-1 / 4}>T / \omega^{2} . \tag{4.3}
\end{equation*}
$$

Since $T=(5 \omega / \epsilon) \log \omega$, this implies

$$
\begin{equation*}
\epsilon(1-\theta / 4)^{i}>(5 \log \omega) / \omega^{2}>1 / \omega^{2} . \tag{4.4}
\end{equation*}
$$

Therefore, using $\epsilon=\omega \theta$ and (P4) (for $i$ ),

$$
\begin{aligned}
& h_{u}^{i+1} \quad \stackrel{(\mathrm{Q4})}{\geq} h_{u}^{i}-2 \theta\left(f_{u}^{i}+e_{u}^{i}\right)-1 / \omega^{2} \\
& \quad \stackrel{(\mathrm{P} 3)}{\geq} h_{u}^{i}-2 \theta\left(16(1-\theta / 4)^{i} \omega+e_{u}^{i}\right)-1 / \omega^{2} \\
& \quad \stackrel{(\mathrm{P} 2)}{\geq} h_{u}^{i}-2 \theta\left(16(1-\theta / 4)^{i} \omega+(1-\theta / 3)^{i} \omega+T / \omega^{2}\right)-1 / \omega^{2} \\
& \quad \geq h_{u}^{i}-2 \theta\left(17(1-\theta / 4)^{i} \omega+T / \omega^{2}\right)-1 / \omega^{2} \\
& \quad \geq(4.3) \\
& \quad=h_{u}^{i}-2 \theta\left(18(1-\theta / 4)^{i} \omega\right)-1 / \omega^{2} \\
& \quad=h_{u}^{i}-36 \epsilon(1-\theta / 4)^{i}-1 / \omega^{2} \\
& \quad \stackrel{(4.4)}{\geq} h_{u}^{i}-37 \epsilon(1-\theta / 4)^{i} \\
& \quad \stackrel{(\mathrm{P} 4)}{\geq} h_{u}^{0}-37 \epsilon \sum_{j=0}^{i-1}(1-\theta / 4)^{j}-37 \epsilon(1-\theta / 4)^{i} \\
& \quad=h_{u}^{0}-37 \epsilon \sum_{j=0}^{i}(1-\theta / 4)^{j} .
\end{aligned}
$$

Proof of (P6). By (R6) and (R7), $\Delta_{2}<\theta \Delta^{5 / 4} \hat{p}$. Using this with (Q6),

$$
d_{G_{c}}^{i+1}(u) \stackrel{(Q 6)}{\leq} \Delta_{2}+2(i+1) \theta \Delta^{5 / 4} \hat{p} \leq 3(i+1) \theta \Delta^{5 / 4} \hat{p}
$$

### 4.3 Proof of Lemma 11

First,

$$
\begin{aligned}
\left|B^{i+1}(u)\right| \hat{p} \log (\hat{p} C)=\sum_{c \in B^{i+1}(u)} \hat{p} \log (\hat{p} C) & =\sum_{c \in B^{i+1}(u)} p_{u}^{i+1}(c) \log \left(p_{u}^{i+1}(c) C\right) \\
& \leq \sum_{c \in C(u)} p_{u}^{i+1}(c) \log \left(p_{u}^{i+1}(c) C\right)
\end{aligned}
$$

$$
\begin{align*}
& =\sum_{c \in C(u)} p_{u}^{i+1}(c) \log p_{u}^{i+1}(c)+\sum_{c \in C(u)} p_{u}^{i+1}(c) \log C \\
& =-h_{u}^{i+1}+\log C \sum_{c \in C(u)} p_{u}^{i+1}(c) . \tag{4.5}
\end{align*}
$$

Using $p_{u}^{0}(c)=1 / C$ for all $c \in C(u)$,

$$
\begin{aligned}
h_{u}^{0} & =-\sum_{c \in C(u)} p_{u}^{0}(c) \log p_{u}^{0}(c) \\
& =\log C \sum_{c \in C(u)} p_{u}^{0}(c) \\
& =\log C \sum_{c \in C(u)}\left(p_{u}^{0}(c)-p_{u}^{i+1}(c)\right)+\log C \sum_{c \in C(u)} p_{u}^{i+1}(c) \\
& =\log C\left(1-w\left(p_{u}^{i+1}\right)\right)+\log C \sum_{c \in C(u)} p_{u}^{i+1}(c) \\
& \stackrel{(\mathrm{P} 1)}{\geq}-1+\log C \sum_{c \in C(u)} p_{u}^{i+1}(c) .
\end{aligned}
$$

Using $\sum_{j=0}^{i}(1-\theta / 4)^{j} \leq 4 / \theta$, the above inequality, and inequality (4.5),

$$
\begin{aligned}
h_{u}^{i+1} \stackrel{(\mathrm{P} 4)}{\geq} h_{u}^{0}-37 \epsilon \sum_{j=0}^{i}(1-\theta / 4)^{j} \geq h_{u}^{0}-148 \epsilon / \theta & \geq \log C \sum_{c \in C(u)} p_{u}^{i+1}(c)-149 \epsilon / \theta \\
& \stackrel{(4.5)}{\geq} h_{u}^{i+1}+\left|B^{i+1}(u)\right| \hat{p} \log (\hat{p} C)-149 \epsilon / \theta .
\end{aligned}
$$

So

$$
\left|B^{i+1}(u)\right| \leq \frac{149 \epsilon}{\theta \hat{p} \log (\hat{p} C)} \stackrel{(\mathrm{R} 1)}{\leq} \epsilon / \hat{p} .
$$

### 4.4 Proof of Lemma 9

Throughout this section, we drop the notation $i+1$ and $i$, and use, for instance, $p_{u}^{\prime}(c)$ and $p_{u}(c)$ to denote values in iterations $i+1$ and $i$, respectively.

We are going to apply the Local Lemma. Our probability space is determined by coin flips at each vertex which determine the random variables $\gamma_{u}(c)$ and $\eta_{u}(c)$. Recall that

$$
N(u)=N^{i}(u)=N_{H}^{i}(u) \cup \cup_{c} N_{c}^{i}(u),
$$

where

$$
N_{c}^{i}(u)=\left\{v \in V\left(G_{c}^{i}\right)-u: \exists e \in G_{c}^{i} \text { with } u, v \in e\right\} .
$$

The random variable $p_{u}^{\prime}(c)$ is determined by the coin flips in $N(u)+u$. Thus an event "( $\mathrm{Q} k$ ) fails to hold for $u$ " (or "(Q6) fails to hold for $u v w ")$ does not depend on the
coin flips outside of $N(N(u)$ ) (or $N(N(u)) \cup N(N(v)) \cup N(N(w))$ ). Consequently, if $v \notin \Gamma(u):=N(N(N(N(N(N(u)))))$ ) (sixth neighborhood), then the events "(Qk) fails to hold for $u$ (or $u b c$ )" and "(Ql) fails to hold for $v$ (or $v w x$ )" are mutually independent. Since $|N(u)| \leq 2 \Delta+\Delta_{2}$, (R6) implies

$$
|\Gamma(u)| \leq\left(2 \Delta+\Delta_{2}\right)^{6}<(3 \Delta)^{6}
$$

To apply the Local Lemma, it therefore suffices to show that the probability that each $(\mathrm{Q} k)$ fails is less than $(3 \Delta)^{-6} / 4$. We prove this for (Q1), (Q2), (Q4), and (Q6) first, and then move on to (Q3) and (Q5).

Proof of (Q1). By (3.5), $\mathbf{E}\left[p_{u}^{\prime}(c)\right]=p_{u}(c)$ for each color $c$. By linearity of expectation,

$$
\mathbf{E}\left[w\left(p_{u}^{\prime}\right)\right]=w\left(p_{u}\right) .
$$

By (R7), $C \hat{p}^{2} \leq \Delta^{-10 / 24}$. Since $w\left(p_{u}^{\prime}\right)$ is the sum of $C$ independent non-negative random variables, each bounded by $\hat{p}$, Theorem 3 implies

$$
\operatorname{Pr}\left[\left|w\left(p_{u}^{\prime}\right)-w\left(p_{u}\right)\right| \geq 1 /(T \log C)\right] \leq 2 e^{-2 /\left(C \hat{p}^{2}(T \log C)^{2}\right)}<2 e^{-7 \log \Delta}
$$

Proof of (Q2). Suppose $u v w \in H$. We first prove

$$
\begin{equation*}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) p_{w}^{\prime}(c)\right] \leq p_{u}(c) p_{v}(c) p_{w}(c)\left(1+1 / \omega_{0}\right) \tag{4.6}
\end{equation*}
$$

Assume that $p_{u}^{\prime}(c), p_{v}^{\prime}(c)$, and $p_{w}^{\prime}(c)$ are determined by (3.3). If $c \in L(u) \cup L(v) \cup L(w)$, then $p_{u}^{\prime}(c) p_{v}^{\prime}(c) p_{w}^{\prime}(c)=0$, so by (3.6),

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) p_{w}^{\prime}(c)\right] & \leq \frac{p_{u}(c)}{q_{u}(c)} \frac{p_{v}(c)}{q_{v}(c)} \frac{p_{w}(c)}{q_{w}(c)} \operatorname{Pr}[c \notin L(u) \cup L(v) \cup L(w)] \\
& \leq p_{u}(c) p_{v}(c) p_{w}(c)\left(1+1 / \omega_{0}\right) .
\end{aligned}
$$

Suppose $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$ are determined by (3.3), and $p_{w}^{\prime}(c)$ is determined by (3.4). Then $p_{w}^{\prime}(c)$ is independent of $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$, so by (3.7),

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) p_{w}^{\prime}(c)\right] & =\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c)\right] \mathbf{E}\left[p_{w}^{\prime}(c)\right] \\
& \leq \frac{p_{u}(c)}{q_{u}(c)} \frac{p_{v}(c)}{q_{v}(c)} \operatorname{Pr}[c \notin L(u) \cup L(v)] p_{w}(c) \\
& \leq p_{u}(c) p_{v}(c) p_{w}(c)\left(1+1 / \omega_{0}\right) .
\end{aligned}
$$

If at least two of $p_{u}^{\prime}(c), p_{v}^{\prime}(c)$, and $p_{w}^{\prime}(c)$ are determined by (3.4), then all three are independent of each other, and

$$
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) p_{w}^{\prime}(c)\right]=p_{u}(c) p_{v}(c) p_{w}(c)
$$

finishing the proof of (4.6).
By definition, $e_{u v w}^{0} \leq C / C^{3}=\omega / \Delta$. By (R3), $\omega^{3}+T<\omega_{0} / 2$. So by (Q2) (for $i$ ),

$$
e_{u v w} / \omega_{0} \stackrel{(Q 2)}{\leq}\left(e_{u v w}^{0}+\frac{i}{\Delta \omega^{2}}\right) \frac{1}{\omega_{0}} \leq\left(\frac{\omega}{\Delta}+\frac{T}{\Delta \omega^{2}}\right) \frac{1}{\omega_{0}}=\frac{\omega^{3}+T}{\omega_{0}} \frac{1}{\Delta \omega^{2}}<1 /\left(2 \Delta \omega^{2}\right) .
$$

So by (4.6),

$$
\begin{aligned}
\mathbf{E}\left[e_{u v w}^{\prime}\right]=\sum_{c \in C(u)} \mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) p_{w}^{\prime}(c)\right] & \leq \sum_{c \in C(u)} p_{u}(c) p_{v}(c) p_{w}(c)\left(1+1 / \omega_{0}\right) \\
& =e_{u v w}\left(1+1 / \omega_{0}\right) \\
& <e_{u v w}+1 /\left(2 \Delta \omega^{2}\right)
\end{aligned}
$$

Now $e_{u v w}^{\prime}$ is the sum of $C$ independent random variables, each bounded by $\hat{p}^{3}$. By (R7), $\Delta^{2} C \hat{p}^{6} \leq \Delta^{-6 / 24}$. Thus Theorem 3 yields

$$
\begin{aligned}
\operatorname{Pr}\left[e_{u v w}^{\prime} \geq e_{u w w}+1 /\left(\Delta \omega^{2}\right)\right] & \leq \operatorname{Pr}\left[e_{u v w}^{\prime} \geq e_{u v w}+1 /\left(2 \Delta \omega^{2}\right)+1 /\left(2 \Delta \omega^{2}\right)\right] \\
& \leq \operatorname{Pr}\left[e_{u v w}^{\prime} \geq \mathbf{E}\left[e_{u v w}^{\prime}\right]+1 /\left(2 \Delta \omega^{2}\right)\right] \\
& <e^{-2 /\left(4 \Delta^{2} \omega^{4} C \hat{P}^{6}\right)} \\
& <e^{-7 \log \Delta}
\end{aligned}
$$

Proof of (Q4). By (3.3) and (3.4), $p_{u}^{\prime}(c)=p_{u}(c) \mathbf{I}[A] / \operatorname{Pr}[A]$ for some event $A$. Thus, using $x \log x=0$ for $x \in\{0,1\}$,

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) \log p_{u}^{\prime}(c)\right] & =\mathbf{E}\left[p_{u}(c) \mathbf{I}[A] / \operatorname{Pr}[A] \log \left(p_{u}(c) \mathbf{I}[A] / \operatorname{Pr}[A]\right)\right] \\
& =\mathbf{E}\left[p_{u}(c) \mathbf{I}[A] / \operatorname{Pr}[A] \log p_{u}(c)+p_{u}(c) \mathbf{I}[A] / \operatorname{Pr}[A] \log (\mathbf{I}[A] / \operatorname{Pr}[A])\right] \\
& =\frac{p_{u}(c) \log p_{u}(c)}{\operatorname{Pr}[A]} \mathbf{E}[\mathbf{I}[A]]+\frac{p_{u}(c)}{\operatorname{Pr}[A]} \mathbf{E}[\mathbf{I}[A] \log (\mathbf{I}[A] / \operatorname{Pr}[A])] \\
& =p_{u}(c) \log p_{u}(c)+\frac{p_{u}(c)}{\operatorname{Pr}[A]} \mathbf{E}[\mathbf{I}[A] \log \mathbf{I}[A]]-\frac{p_{u}(c)}{\operatorname{Pr}[A]} \mathbf{E}[\mathbf{I}[A] \log \operatorname{Pr}[A]] \\
& =p_{u}(c) \log p_{u}(c)+\frac{p_{u}(c)}{\operatorname{Pr}[A]} \mathbf{E}[0]-p_{u}(c) \log \operatorname{Pr}[A] \\
& =p_{u}(c) \log p_{u}(c)-p_{u}(c) \log \operatorname{Pr}[A] .
\end{aligned}
$$

Recall that

$$
q_{u}(c)=\operatorname{Pr}\left[\bigcap_{\substack{\{v, w\} ; \\ u v w \in H}}\left(\gamma_{v}(c)=0 \cup \gamma_{w}(c)=0\right) \bigcap_{v: u v \in G_{c}} \gamma_{v}(c)=0\right]
$$

Also, $1-r x \geq(1-x)^{r}$ for $r, x \in(0,1)$. Finally, $\mathbf{I}\left[\gamma_{v}(c)=0 \cup \gamma_{w}(c)=0\right]$ and $\mathbf{I}\left[\gamma_{v}(c)=0\right]$ are increasing functions of the indicators $\mathbf{I}\left[\gamma_{v}(c)=0\right]$, so by the FKG inequality,

$$
\begin{aligned}
q_{u}(c) & =\mathbf{E}\left[\prod_{u v w \in H} \mathbf{I}\left[\gamma_{v}(c)=0 \cup \gamma_{w}(c)=0\right] \prod_{u v \in G_{c}} \mathbf{I}\left[\gamma_{v}(c)=0\right]\right] \\
& \stackrel{\mathrm{FKG}}{\geq} \prod_{u v w \in H} \mathbf{E}\left[\mathbf{I}\left[\gamma_{v}(c)=0 \cup \gamma_{w}(c)=0\right]\right] \prod_{u v \in G_{c}} \mathbf{E}\left[\mathbf{I}\left[\gamma_{v}(c)=0\right]\right] \\
& =\prod_{u v w \in H} \operatorname{Pr}\left[\gamma_{v}(c)=0 \cup \gamma_{w}(c)=0\right] \prod_{u v \in G_{c}} \operatorname{Pr}\left[\gamma_{v}(c)=0\right] \\
& =\prod_{u v w \in H}\left(1-\theta^{2} p_{v}(c) p_{w}(c)\right) \prod_{u v \in G_{c}}\left(1-\theta p_{v}(c)\right) \\
& \geq \prod_{u v w \in H}(1-\theta)^{\theta p_{v}(c) p_{w}(c)} \prod_{u v \in G_{c}}(1-\theta)^{p_{v}(c)} .
\end{aligned}
$$

By the algorithm, $\operatorname{Pr}[A] \geq q_{u}(c)$. Also, $\log (1-x) \geq-x-x^{2}$ for $x \in[0,1 / 3]$. Combining these inequalities with the previous inequality, we obtain

$$
\begin{aligned}
\log \operatorname{Pr}[A] \geq \log q_{u}(c) & \geq \log \left(\prod_{u v w \in H}(1-\theta)^{\theta p_{v}(c) p_{w}(c)} \prod_{u v \in G_{c}}(1-\theta)^{p_{v}(c)}\right) \\
& =\sum_{u v w \in H} \theta p_{v}(c) p_{w}(c) \log (1-\theta)+\sum_{u v \in G_{c}} p_{v}(c) \log (1-\theta) \\
& \geq \sum_{u v w \in H} \theta p_{v}(c) p_{w}(c)\left(-\theta-\theta^{2}\right)+\sum_{u v \in G_{c}} p_{v}(c)\left(-\theta-\theta^{2}\right) \\
& =\left(-\theta^{2}-\theta^{3}\right) \sum_{u v w \in H} p_{v}(c) p_{w}(c)+\left(-\theta-\theta^{2}\right) \sum_{u v \in G_{c}} p_{v}(c) \\
& =-\left(\theta^{2}+\theta^{3}\right) e_{u}(c)-\left(\theta+\theta^{2}\right) f_{u}(c) .
\end{aligned}
$$

Therefore, using the definition of $h_{u}$ and $\theta<1 / 3$,

$$
\begin{aligned}
\mathbf{E}\left[h_{u}-h_{u}^{\prime}\right] & =h_{u}+\sum_{c \in C(u)} \mathbf{E}\left[p_{u}^{\prime}(c) \log p_{u}^{\prime}(c)\right] \\
& \left.=h_{u}+\sum_{c \in C(u)} p_{u}(c) \log p_{u}(c)-\sum_{c \in C(u)} p_{u}(c) \log \operatorname{Pr}[A]\right) \\
& =-\sum_{c \in C(u)} p_{u}(c) \log \operatorname{Pr}[A] \\
& \leq \sum_{c \in C(u)} p_{u}(c)\left(\left(\theta+\theta^{2}\right) f_{u}(c)+\left(\theta^{2}+\theta^{3}\right) e_{u}(c)\right) \\
& =\left(\theta+\theta^{2}\right) f_{u}+\left(\theta^{2}+\theta^{3}\right) e_{u} \\
& <2 \theta\left(f_{u}+e_{u}\right) .
\end{aligned}
$$

The terms in $\sum_{c}-p_{u}^{\prime}(c) \log p_{u}^{\prime}(c)$ are independent and, since $-x \log x$ is increasing for $0<x \leq \hat{p}$, bounded by $-\hat{p} \log \hat{p}$. Also $x^{2} \log ^{2} x$ is increasing, so by (R7), $C(-\hat{p} \log \hat{p})^{2} \leq$
$\Delta^{-10 / 24-o(1)}$. Thus, by Theorem 3,

$$
\operatorname{Pr}\left[h_{u}-h_{u}^{\prime} \geq 2 \theta\left(f_{u}+e_{u}\right)+1 / \omega^{2}\right]<e^{-2 /\left(\omega^{4} C(-\hat{p} \log \hat{p})^{2}\right)}<e^{-7 \log \Delta} .
$$

Proof of (Q6). Fix $c \in C(u)$. For each $v \in N_{H}(u)$, set

$$
X_{v}=d_{H}(u, v) \gamma_{v}(c),
$$

and set

$$
X=\sum_{v \in N_{H}(u)} X_{v} .
$$

Then

$$
\mathbf{E}[X]=\sum_{v \in N_{H}(u)} d_{H}(u, v) p_{v}(c) \theta \leq \hat{p} \theta \sum_{v \in N_{H}(u)} d_{H}(u, v) \leq 2 \Delta \hat{p} \theta .
$$

Since the $X_{v}$ are independent from each other (because the $\gamma_{v}(c)$ are independent), and $x(1-x)$ is increasing for $x<1 / 2$,

$$
\begin{aligned}
\operatorname{Var}[X]=\sum_{v \in N_{H}(u)} \operatorname{Var}\left[X_{v}\right] & =\sum_{v \in N_{H}(u)}\left(\mathbf{E}\left[X_{v}^{2}\right]-\mathbf{E}\left[X_{v}\right]^{2}\right) \\
& =\sum_{v \in N_{H}(u)}\left(d_{H}(u, v)^{2} p_{v}(c) \theta-d_{H}(u, v)^{2} p_{v}(c)^{2} \theta^{2}\right) \\
& \leq \sum_{v \in N_{H}(u)} d_{H}(u, v)^{2} \hat{p} \theta(1-\hat{p} \theta) \\
& =\hat{p} \theta(1-\hat{p} \theta) \sum_{v \in N_{H}(u)} d_{H}(u, v)^{2} \\
& \leq \hat{p} \theta(1-\hat{p} \theta) \delta \sum_{v \in N_{H}(u)} d_{H}(u, v) \\
& =\hat{p} \theta(1-\hat{p} \theta) 2 \Delta \delta \\
& <\hat{p} \theta 2 \Delta \delta .
\end{aligned}
$$

If $u v \notin G_{c}$ and $u v \in G_{c}^{\prime}$, then there exists an edge $u v w \in H$ such that $\gamma_{w}(c)=1$. Hence

$$
d_{G_{c}}^{\prime}(u)-d_{G_{c}}(u) \leq \sum_{u v w \in H}\left(\gamma_{v}(c)+\gamma_{w}(c)\right)=\sum_{v \in N_{H}(u)} d_{H}(u, v) \gamma_{v}(c)=X .
$$

Since $\hat{p} \geq \Delta^{-1 / 2}$ and $\delta \leq \Delta^{6 / 10}\left((\mathrm{R} 7)\right.$ and (R5)), $\Delta^{5 / 4} \hat{p} / \delta \geq \Delta^{3 / 20}$. Applying Theorem 4 (with $b=\delta$ ),

$$
\begin{aligned}
\operatorname{Pr}\left[d_{G_{c}}^{\prime}(u)-d_{G_{c}}(u) \geq 2 \Delta^{5 / 4} \hat{p} \theta\right] & \leq \operatorname{Pr}\left[X \geq \Delta^{5 / 4} \hat{p} \theta+\Delta^{5 / 4} \hat{p} \theta\right] \\
& \leq \operatorname{Pr}\left[X \geq \mathbf{E}[X]+\Delta^{5 / 4} \hat{p} \theta\right] \\
& \leq e^{-\Delta^{10 / 4} \hat{p}^{2} \theta^{2} /\left(4 \hat{p} \theta \Delta \delta+\delta \Delta^{5 / 4} \hat{p} \theta\right)}
\end{aligned}
$$

$$
\begin{aligned}
& <e^{-\Delta^{10 / 4} \hat{p}^{2} \theta^{2} / 5 \delta \Delta^{5 / 4} \hat{p} \theta} \\
& =e^{-\Delta^{5 / 4} \hat{p} \theta / 5 \delta} \\
& <e^{-7 \log \Delta} .
\end{aligned}
$$

We now prove (Q3) and (Q5). The following two claims will be used in both proofs.
Claim 12. For any $v \in U$ and $c \in C(v)$,

$$
\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(v)\right] \geq \operatorname{Pr}\left[v \notin U^{\prime}\right] \geq 3 \theta / 4,
$$

and if $u v \in G_{c}$, then
$\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(u)\right] \geq \operatorname{Pr}\left[v \notin U^{\prime}\right]-\theta \hat{p} \geq 5 \theta / 8$,
$\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(u) \cup L(v)\right] \geq \operatorname{Pr}\left[v \notin U^{\prime}\right]-\theta \hat{p} \geq 5 \theta / 8$.
Proof of claim. The vertex $v$ is colored (i.e., $v \notin U^{\prime}$ ) if and only if for some color $d \notin B(v), \gamma_{v}(d)=1$ and $d \notin L(v)$. Let $R_{d}$ denote the event that $\gamma_{v}(d)=1$ and $d \notin L(v)$. If $c \in B(v)$, then $v$ cannot be colored $c$, so the event $v \notin U^{\prime}$ is independent of the events $c \notin L(v)$ and $c \notin L(u)$; hence
$\operatorname{Pr}\left[v \notin U^{\prime}\right]=\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(v)\right]=\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(u)\right]=\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(u) \cup L(v)\right]$.
Otherwise,

$$
\begin{aligned}
\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(v)\right] & =\frac{\operatorname{Pr}\left[v \notin U^{\prime}, c \notin L(v)\right]}{\operatorname{Pr}[c \notin L(v)]} \\
& =\frac{\operatorname{Pr}\left[\cup_{d \in C(v)-B(v)} R_{d}, c \notin L(v)\right]}{\operatorname{Pr}[c \notin L(v)]} \\
& =\frac{\operatorname{Pr}\left[\left(\cup_{d \in C(v)-B(v)-c} R_{d} \cup R_{c}\right), c \notin L(v)\right]}{\operatorname{Pr}[c \notin L(v)]} \\
& =\frac{\operatorname{Pr}\left[\left(\cup_{d \in C(v)-B(v)-c} R_{d} \cup \gamma_{v}(c)=1\right), c \notin L(v)\right]}{\operatorname{Pr}[c \notin L(v)]} \\
& =\frac{\operatorname{Pr}\left[\left(\cup_{d \in C(v)-B(v)-c} R_{d} \cup \gamma_{v}(c)=1\right)\right] \operatorname{Pr}[c \notin L(v)]}{\operatorname{Pr}[c \notin L(v)]} \\
& =\operatorname{Pr}\left[\left(\cup_{d \in C(v)-B(v)-c} R_{d}\right) \cup\left(\gamma_{v}(c)=1\right)\right] \\
& \geq \operatorname{Pr}\left[\left(\cup_{d \in C(v)-B(v)-c} R_{d}\right) \cup R_{c}\right] \\
& =\operatorname{Pr}\left[v \notin U^{\prime}\right] .
\end{aligned}
$$

Suppose $u v \in G_{c}$. If $c \notin L(u)$, then $\gamma_{w}(c)=0$ for all $w \in N_{G_{c}}(u)$, so in particular, $\gamma_{v}(c)=0$. Consequently,

$$
\operatorname{Pr}\left[R_{c} \mid c \notin L(u) \cup L(v)\right]=\operatorname{Pr}\left[\gamma_{v}(c)=1 \cap c \notin L(v) \mid c \notin L(u) \cup L(v)\right]=0 .
$$

So by the independence of colors and the inequality

$$
\operatorname{Pr}\left[\cup_{d \in C(v)-B(v)} R_{d}\right] \leq \operatorname{Pr}\left[\cup_{d \in C(v)-B(v)-c} R_{d}\right]+\operatorname{Pr}\left[R_{c}\right],
$$

we obtain

$$
\begin{aligned}
\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(u) \cup L(v)\right] & =\operatorname{Pr}\left[\cup_{d \in C(v)-B(v)} R_{d} \mid c \notin L(u) \cup L(v)\right] \\
& =\operatorname{Pr}\left[\cup_{d \in C(v)-B(v)-c} R_{d}\right] \\
& \geq \operatorname{Pr}\left[\cup_{d \in C(v)-B(v)} R_{d}\right]-\operatorname{Pr}\left[R_{c}\right] \\
& \geq \operatorname{Pr}\left[v \notin U^{\prime}\right]-\theta \hat{p} .
\end{aligned}
$$

Since we only used the condition $c \notin L(u)$, the same proof also yields

$$
\operatorname{Pr}\left[v \notin U^{\prime} \mid c \notin L(u)\right] \geq \operatorname{Pr}\left[v \notin U^{\prime}\right]-\theta \hat{p}
$$

To finish the proof of the claim, we now show $\operatorname{Pr}\left[v \notin U^{\prime}\right] \geq 3 \theta / 4$. First,

$$
\begin{aligned}
\operatorname{Pr}\left[v \notin U^{\prime}\right] & =\operatorname{Pr}\left[\cup_{d \in C(v)-B(v)} R_{d}\right] \\
& \geq \sum_{d \in C(v)-B(v)} \operatorname{Pr}\left[R_{d}\right]-\sum_{d, d^{\prime} \in C(v)-B(v)} \operatorname{Pr}\left[R_{d}\right] \operatorname{Pr}\left[R_{d^{\prime}}\right] \\
& =\sum_{d \in C(v)-B(v)} \theta p_{v}(d) q_{v}(d)-\sum_{d, d^{\prime} \in C(v)-B(v)} \theta^{2} p_{v}(d) p_{v}\left(d^{\prime}\right) q_{v}(d) q_{v}\left(d^{\prime}\right) \\
& \geq \theta \sum_{d \in C(v)} p_{v}(d) q_{v}(d)-\theta \sum_{d \in B(v)} p_{v}(d) q_{v}(d)-\theta^{2} \sum_{d, d^{\prime} \in C(v)-B(v)} p_{v}(d) p_{v}\left(d^{\prime}\right) \\
& \geq \theta \sum_{d \in C(v)} p_{v}(d) q_{v}(d)-\theta|B(v)| \hat{p}-\theta^{2} \sum_{d, d^{\prime} \in C(v)-B(v)} p_{v}(d) p_{v}\left(d^{\prime}\right) .
\end{aligned}
$$

By (3.2),

$$
\begin{aligned}
q_{v}(d) & \geq 1-\sum_{u v w \in H} \theta^{2} p_{u}(d) p_{w}(d)-\sum_{u v \in G_{d}} \theta p_{u}(d) \\
& =1-\theta^{2} \sum_{u v w \in H} p_{u}(d) p_{w}(d)-\theta \sum_{u v \in G_{d}} p_{u}(d) \\
& =1-\theta^{2} e_{v}(d)-\theta f_{v}(d) .
\end{aligned}
$$

By (P1) and $1 / \log C=o(1)$ we have

$$
\sum_{d \in C(v)} p_{v}(d) \leq 1+\frac{i}{T \log C} \leq 1+\frac{1}{\log C}<\sqrt{2}
$$

Consquently,

$$
\theta^{2} \sum_{d, d^{\prime} \in C(v)-B(v)} p_{v}(d) p_{v}\left(d^{\prime}\right) \leq \frac{1}{2} \theta^{2} \sum_{d \in C(v)} \sum_{d^{\prime} \in C(v)-d} p_{v}(d) p_{v}\left(d^{\prime}\right) \leq \frac{1}{2} \theta^{2}\left(\sum_{d \in C} p_{v}(d)\right)^{2} \leq \theta^{2} .
$$

By our lemma's assumption, $|B(v)| \leq \epsilon / \hat{p}$. By (P3), $f_{v}<16 \omega$, so $\theta f_{v}<16 \epsilon$. By (P2), $e_{v} \leq \omega+T / \omega^{2}$, so by definition of $T$ and $\theta, \theta^{2} e_{v} \leq \epsilon / 3$. Using these three inequalities, $\sum_{d \in C(v)} p_{v}(d) \geq(1-\epsilon / 3)$, and (R4), we finally obtain

$$
\begin{aligned}
\operatorname{Pr}\left[v \notin U^{\prime}\right] & \geq \theta \sum_{d \in C(v)} p_{v}(d)\left(1-\theta^{2} e_{v}(d)-\theta f_{v}(d)\right)-\theta|B(v)| \hat{p}-\theta^{2} \\
& =\theta \sum_{d \in C(v)} p_{v}(d)-\theta^{3} \sum_{d \in C(v)} p_{v}(d) e_{v}(d)-\theta^{2} \sum_{d \in C(v)} p_{v}(d) f_{v}(d)-\theta|B(v)| \hat{p}-\theta^{2} \\
& \geq \theta \sum_{d \in C(v)} p_{v}(d)-\theta^{3} \sum_{d \in C(v)} p_{v}(d) e_{v}(d)-\theta^{2} \sum_{d \in C(v)} p_{v}(d) f_{v}(d)-\theta \epsilon-\theta^{2} \\
& =\theta \sum_{d \in C(v)} p_{v}(d)-\theta^{3} e_{v}-\theta^{2} f_{v}-\theta \epsilon-\theta^{2} \\
& \geq \theta(1-\epsilon / 3)-\theta \epsilon / 3-16 \theta \epsilon-\theta \epsilon-\theta \epsilon / 3 \\
& =\theta(1-18 \epsilon) \\
& \geq 3 \theta / 4 .
\end{aligned}
$$

Recall that $m$ is a fixed constant.
Claim 13. For each $l=0, \ldots, m-2$, let

$$
N^{0}(u, l)=\left\{v \in N_{H}^{0}(u)-N_{G}^{0}(u): \Delta^{l / 2 m}<d_{H}^{0}(u, v) \leq \Delta^{(l+1) / 2 m}\right\},
$$

and for $l=m-1$, let

$$
N^{0}(u, l)=\left\{v \in N_{H}^{0}(u): d_{H}^{0}(u, v)>\Delta^{l / 2 m}\right\} \cup N_{G}^{0}(u) .
$$

For each $l$ and color $c$, let $\mathcal{A}_{c, l}$ be the event that $\gamma_{v}(c)=1$ for at most $\Delta^{1-l / 2 m} \hat{p}$ vertices $v \in N^{0}(u, l)$. Let $\mathcal{A}$ denote the event that $\mathcal{A}_{c, l}$ holds for all l and $c$. Then

$$
\operatorname{Pr}[\overline{\mathcal{A}}] \leq e^{-10 \log \Delta} .
$$

Proof of claim. Suppose $l<m-1$. Since each $v \in N^{0}(u, l)$ contributes at least $\Delta^{l / 2 m}$ edges to $d_{H}^{0}(u)$, and each edge is counted at most twice,

$$
\left|N^{0}(u, l)\right| \leq 2 \Delta / \Delta^{l / 2 m}=2 \Delta^{1-l / 2 m} .
$$

If $l=m-1$,

$$
\left|N^{0}(u, l)\right| \leq 2 \Delta / \Delta^{l / 2 m}+\Delta_{2}=2 \Delta^{1-l / 2 m}+\Delta_{2} \stackrel{(\mathrm{R} 6)}{<} 3 \Delta^{1-l / 2 m} .
$$

Thus $\left|N^{0}(u, l)\right|<3 \Delta^{1-l / 2 m}$ for each $l$.

Since $\operatorname{Pr}\left[\gamma_{v}(c)=1\right] \leq \hat{p} \theta$ and $3 e \theta<1 / e$,

$$
\begin{aligned}
\operatorname{Pr}\left[\overline{\mathcal{A}}_{c, l}\right] \leq\binom{\left|N^{0}(u, l)\right|}{\Delta^{1-l / 2 m} \hat{p}}(\hat{p} \theta)^{\Delta^{1-l / 2 m} \hat{p}} & \leq\binom{ 3 \Delta^{1-l / 2 m}}{\Delta^{1-l / 2 m} \hat{p}}(\hat{p} \theta)^{\Delta^{1-l / 2 m} \hat{p}} \\
& \left.\leq\left(\frac{3 e}{\hat{p}}\right)^{\Delta^{1-l / 2 m} \hat{p}} \hat{p} \theta\right)^{\Delta^{1-l / 2 m} \hat{p}} \\
& =(3 e \theta)^{\Delta^{1-l / 2 m} \hat{p}} \\
& <e^{-\Delta^{1-l / 2 m} \hat{p}} \\
& \stackrel{(\mathrm{R} T)}{\leq} e^{-\Delta^{(m+1) / 2 m} \Delta^{-1 / 2}} \\
& =e^{-\Delta^{1 / 2 m}} .
\end{aligned}
$$

So by the union bound,

$$
\operatorname{Pr}[\overline{\mathcal{A}}] \leq C m e^{-\Delta^{1 / 2 m}} \leq e^{-10 \log \Delta}
$$

Proof of (Q3). Observe that

$$
\begin{aligned}
f_{u}^{\prime} & =\sum_{c \in C(u)} \sum_{v: u v \in G_{c}^{\prime}} p_{u}^{\prime}(c) p_{v}^{\prime}(c) \\
& =\sum_{c \in C(u)} \sum_{v: u v \in G_{c}} p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[u v \in G_{c}^{\prime}\right]+\sum_{\substack{c \in C(u)}} \sum_{\substack{v u v \notin G_{c}, u v \in G_{c}^{\prime}}} p_{u}^{\prime}(c) p_{v}^{\prime}(c) \\
& \leq \sum_{c \in C(u)} \sum_{v: u v \in G_{c}} p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right] \\
& +\sum_{c \in C(u)} \sum_{\substack{v, w\}: \\
u v w \in H}}\left(p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[\gamma_{w}(c)=1\right]+p_{u}^{\prime}(c) p_{w}^{\prime}(c) \mathbf{I}\left[\gamma_{v}(c)=1\right]\right) \\
& =D_{1}+D_{2},
\end{aligned}
$$

where

$$
D_{1}=\sum_{c \in C(u)} \sum_{v: u v \in G_{c}} p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right],
$$

and

$$
D_{2}=\sum_{c \in C(u)} \sum_{\substack{\{v, w\}: \\ u v w \in H}}\left(p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[\gamma_{w}(c)=1\right]+p_{u}^{\prime}(c) p_{w}^{\prime}(c) \mathbf{I}\left[\gamma_{v}(c)=1\right]\right) .
$$

### 4.4.1 Bound on $D_{1}$

To bound $D_{1}$, we first prove that for $u v \in G_{c}$,

$$
\begin{equation*}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right]\right] \leq p_{u}(c) p_{v}(c)(1-9 \theta / 16) \tag{4.7}
\end{equation*}
$$

Note that by (R3),

$$
\begin{equation*}
1 / \omega_{0}<1 / \omega^{4}=o(\theta) \tag{4.8}
\end{equation*}
$$

First assume that $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$ are determined by (3.3). If $c \in L(u) \cup L(v)$, then $p_{u}^{\prime}(c) p_{v}^{\prime}(c)=0$, so using (3.8), Claim 12, and then (4.8),

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right]\right] & =\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mid v \in U^{\prime}\right] \operatorname{Pr}\left[v \in U^{\prime}\right] \\
& \leq \frac{p_{u}(c)}{q_{u}(c)} \frac{p_{v}(c)}{q_{v}(c)} \operatorname{Pr}\left[c \notin L(u) \cup L(v) \mid v \in U^{\prime}\right] \operatorname{Pr}\left[v \in U^{\prime}\right] \\
& =\frac{p_{u}(c)}{q_{u}(c)} \frac{p_{v}(c)}{q_{v}(c)} \operatorname{Pr}\left[v \in U^{\prime} \mid c \notin L(u) \cup L(v)\right] \operatorname{Pr}[c \notin L(u) \cup L(v)] \\
& \stackrel{(3.8)}{\leq} p_{u}(c) p_{v}(c)\left(1+1 / \omega_{0}\right) \operatorname{Pr}\left[v \in U^{\prime} \mid c \notin L(u) \cup L(v)\right] \\
& \stackrel{\text { C.12 }}{\leq} p_{u}(c) p_{v}(c)\left(1+1 / \omega_{0}\right)(1-5 \theta / 8) \\
& \stackrel{(4.8)}{\leq} p_{u}(c) p_{v}(c)(1-9 \theta / 16) .
\end{aligned}
$$

Suppose $p_{u}^{\prime}(c)$ is determined by (3.3) and $p_{v}^{\prime}(c)$ is determined by (3.4). Then $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$ are independent of each other, and $p_{v}^{\prime}(c)$ is independent of the event $v \in U^{\prime}$, so

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right]\right] & =\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mid v \in U^{\prime}\right] \operatorname{Pr}\left[v \in U^{\prime}\right] \\
& =\mathbf{E}\left[p_{u}^{\prime}(c) \mid v \in U^{\prime}\right] \mathbf{E}\left[p_{v}^{\prime}(c)\right] \operatorname{Pr}\left[v \in U^{\prime}\right] \\
& \stackrel{(3.5)}{\leq} \mathbf{E}\left[p_{u}^{\prime}(c) \mid v \in U^{\prime}\right] p_{v}(c) \operatorname{Pr}\left[v \in U^{\prime}\right] \\
& \leq \frac{p_{u}(c)}{q_{u}(c)} \operatorname{Pr}\left[c \notin L(u) \mid v \in U^{\prime}\right] \operatorname{Pr}\left[v \in U^{\prime}\right] p_{v}(c) \\
& =\frac{p_{u}(c)}{q_{u}(c)} \operatorname{Pr}\left[v \in U^{\prime} \mid c \notin L(u)\right] \operatorname{Pr}[c \notin L(u)] p_{v}(c) \\
& =p_{u}(c) p_{v}(c) \operatorname{Pr}\left[v \in U^{\prime} \mid c \notin L(u)\right] \\
& \stackrel{\text { C.12 }}{\leq} p_{u}(c) p_{v}(c)\left(1+1 / \omega_{0}\right)(1-5 \theta / 8) \\
& \stackrel{(4.8)}{\leq} p_{u}(c) p_{v}(c)(1-9 \theta / 16) .
\end{aligned}
$$

Similarly, if $p_{u}^{\prime}(c)$ is determined by (3.4) and $p_{v}^{\prime}(c)$ is determined by (3.3),

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right]\right] & \leq p_{u}(c) p_{v}(c) \operatorname{Pr}\left[v \in U^{\prime} \mid c \notin L(v)\right] \\
& \stackrel{\text { C.12 }}{\leq} p_{u}(c) p_{v}(c)\left(1+1 / \omega_{0}\right)(1-5 \theta / 8) \\
& \stackrel{(4.8)}{\leq} p_{u}(c) p_{v}(c)(1-9 \theta / 16) .
\end{aligned}
$$

If $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$ are both determined by (3.4),

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right]\right] & =\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c)\right] \operatorname{Pr}\left[v \in U^{\prime}\right] \\
& =\mathbf{E}\left[p_{u}^{\prime}(c)\right] \mathbf{E}\left[p_{v}^{\prime}(c)\right] \operatorname{Pr}\left[v \in U^{\prime}\right] \\
& \stackrel{(\mathrm{C} .12)}{\leq} p_{u}(c) p_{v}(c)(1-3 \theta / 4)
\end{aligned}
$$

$$
<p_{u}(c) p_{v}(c)(1-9 \theta / 16)
$$

concluding the proof of (4.7).
By (4.7),

$$
\begin{aligned}
\mathbf{E}\left[D_{1}\right] & =\sum_{c \in C(u)} \sum_{v: u v \in G_{c}} \mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right]\right] \\
& \leq \sum_{c \in C(u)} \sum_{v: u v \in G_{c}} p_{u}(c) p_{v}(c)(1-9 \theta / 16) \\
& =f_{u}(1-9 \theta / 16) .
\end{aligned}
$$

For $c \in C(u)$, let

$$
T_{c}=\left\{\gamma_{v}(c): v \in N(N(u))\right\} \cup\left\{\eta_{v}(c): v \in N(N(u))\right\} .
$$

Then each $T_{c}$ is a (vector valued) random variable, and the set of random variables $\left\{T_{c}: c \in C(u)\right\}$ are mutually independent and determine the variable $D_{1}$. We will now apply Corollary 6 with parameters:

- $\mathcal{B}_{c}=\{0,1\}^{2|N(N(u))|}$, for each $c \in C(u)$
- Independent random variables $T_{c}:\{c\} \rightarrow\{0,1\}^{2|N(N(u))|}$, for each $c \in C(u)$
- Events $\mathcal{A}_{c}=\cap_{l=1}^{m} \mathcal{A}_{c, l}$, for each $c \in C(u)$ (where $\mathcal{A}_{c, l}$ is from Claim 13)
- $\mathcal{A}=\prod_{c \in C(u)} \mathcal{A}_{c}$, for each $c \in C(u)$ (this is the same $\mathcal{A}$ as in Claim 13)
- $D_{1}$ (which is non-negative) in the role of $Y$, so that $D_{1}: \prod_{c \in C(u)} \mathcal{B}_{c} \rightarrow \mathbb{R}$.
- $d_{c}=d_{G_{c}(u)} \hat{p}^{2}+2 m \hat{p}^{3} \Delta^{1+1 / 2 m}$, for each $c \in C(u)$.

Fix $c \in C(u)$. Let $x, x^{\prime} \in \mathcal{A}$ such that $x$ and $x^{\prime}$ differ only in coordinate $c$. Our goal is to show that $\left|D_{1}(x)-D_{1}\left(x^{\prime}\right)\right| \leq d_{c}$. Note first that

$$
\begin{aligned}
D_{1} & =\sum_{v: u v \in G_{c}} p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[v \in U^{\prime}\right]+\sum_{l=0}^{m-1} \sum_{v \in N^{0}(u, l)} \mathbf{I}\left[v \in U^{\prime}\right] \sum_{\substack{d \in C(u)-c: \\
u v \in G_{d}}} p_{u}^{\prime}(d) p_{v}^{\prime}(d) \\
& :=D_{1,1}+\sum_{l=0}^{m-1} \sum_{v \in N^{0}(u, l)} D_{1,2}^{v}
\end{aligned}
$$

Since $0 \leq D_{1,1} \leq d_{G_{c}}(u) \hat{p}^{2}$,

$$
\begin{equation*}
\left|D_{1,1}(x)-D_{1,1}\left(x^{\prime}\right)\right| \leq d_{G_{c}}(u) \hat{p}^{2} \tag{4.9}
\end{equation*}
$$

Fix $l$. Let $v \in N^{0}(u, l)$. If $l \leq m-2$, then $u v \in G_{d}$ only if there exists a vertex $w$ such that $u v w \in H^{0}$ and $w$ received color $d$ in a previous round. Thus $u v$ is in at most $d_{H}^{0}(u, v) \leq \Delta^{(l+1) / 2 m}$ graphs $G_{d}$, which implies

$$
\begin{equation*}
\left|D_{1,2}^{v}(x)-D_{1,2}^{v}\left(x^{\prime}\right)\right| \leq \Delta^{(l+1) / 2 m} \hat{p}^{2}, \quad l \leq m-2 . \tag{4.10}
\end{equation*}
$$

If $l=m-1$, then $u v$ is in at most $C$ graphs $G_{d}$, so

$$
\begin{equation*}
\left|D_{1,2}^{v}(x)-D_{1,2}^{v}\left(x^{\prime}\right)\right| \leq C \hat{p}^{2} \leq \Delta^{1 / 2} \hat{p}^{2}, \quad l=m-1 . \tag{4.11}
\end{equation*}
$$

Note that $x$ and $x^{\prime}$ are vectors of length $|C(u)|$. The $c^{\text {th }}$ coordinate of each vector is a vector of length $2|N(N(u))|$, and the entries in these vectors correspond to the values assigned to the random variables $\gamma_{v}(c)$ and $\eta_{v}(c)$ for all $v \in N(N(u))$. Let $x_{c}(\gamma, v)$ and $x_{c}^{\prime}(\gamma, v)$ denote the values of $\gamma_{v}(c)$ corresponding to $x$ and $x^{\prime}$, respectively.

Suppose $x_{c}(\gamma, v)=x_{c}^{\prime}(\gamma, v)=0$. Then $v$ cannot be colored $c$ during the current iteration. Thus changing the value of $\gamma_{w}(c)$ for any $w \in N(N(u))-v$ does not affect whether or not $v$ is colored. Therefore $\mathbf{I}\left[v \in U^{\prime}\right](x)=\mathbf{I}\left[v \in U^{\prime}\right]\left(x^{\prime}\right)$. In addition, $p_{u}^{\prime}(d) p_{v}^{\prime}(d)(x)=$ $p_{u}^{\prime}(d) p_{v}^{\prime}(d)\left(x^{\prime}\right)$ for any $d \in C(u)-c$. Thus $D_{1,2}^{v}(x)=D_{1,2}^{v}\left(x^{\prime}\right)$ if $x_{c}(\gamma, v)=x_{c}^{\prime}(\gamma, v)=0$.

By definition of $\mathcal{A}_{c, l}, x_{c}(\gamma, v)=1$ for at most $\Delta^{1-l / 2 m} \hat{p}$ vertices $v \in N^{0}(u, l)$. Therefore $D_{1,2}^{v}(x) \neq D_{1,2}^{v}\left(x^{\prime}\right)$ for at most $2 \Delta^{1-l / 2 m} \hat{p}$ vertices $v \in N^{0}(u, l)$. So by (4.11) and (4.10),

$$
\begin{aligned}
\sum_{l=0}^{m-1} \sum_{v \in N^{0}(u, l)}\left|D_{1,2}^{v}(x)-D_{1,2}^{v}\left(x^{\prime}\right)\right| & \leq 2 \Delta^{1+1 / 2 m} \hat{p}^{3}+\sum_{l=0}^{m-2}\left(2 \Delta^{1-l / 2 m} \hat{p}\right)\left(\Delta^{(l+1) / 2 m} \hat{p}^{2}\right) \\
& =2 m \Delta^{1+1 / 2 m} \hat{p}^{3}
\end{aligned}
$$

Combining this with (4.9),

$$
\left|D_{1}(x)-D_{1}\left(x^{\prime}\right)\right| \leq d_{G_{c}}(u) \hat{p}^{2}+2 m \Delta^{1+1 / 2 m} \hat{p}^{3}=d_{c} .
$$

Since $\sum_{c \in C(u)} d_{G_{c}}(u) \leq \Delta+\Delta_{2}<2 \Delta$ and, by $(\mathrm{P} 6), d_{G_{c}}(u) \leq 3 T \theta \Delta^{5 / 4} \hat{p}$,

$$
\begin{aligned}
& \sum_{c \in C(u)}\left(d_{G_{c}}(u) \hat{p}^{2}+2 m \hat{p}^{3} \Delta^{1+1 / 2 m}\right)^{2} \\
& \leq 4 C m^{2} \hat{p}^{6} \Delta^{2+1 / m}+\sum_{c \in C(u)}\left(\hat{p}^{4} d_{G_{c}}(u)^{2}+d_{G_{c}}(u) 4 m \hat{p}^{5} \Delta^{1+1 / 2 m}\right) \\
& \leq 4 C m^{2} \hat{p}^{6} \Delta^{2+1 / m}+8 m \hat{p}^{5} \Delta^{2+1 / 2 m}+\hat{p}^{4} \sum_{c \in C(u)} d_{G_{c}}(u)^{2} \\
& \leq 4 C m^{2} \hat{p}^{6} \Delta^{2+1 / m}+8 m \hat{p}^{5} \Delta^{2+1 / 2 m}+3 \hat{p}^{5} T \theta \Delta^{5 / 4} \sum_{c \in C(u)} d_{G_{c}}(u) \\
& \leq 4 C m^{2} \hat{p}^{6} \Delta^{2+1 / m}+8 m \hat{p}^{5} \Delta^{2+1 / 2 m}+6 T \theta \hat{p}^{5} \Delta^{9 / 4} .
\end{aligned}
$$

By (R7), $\hat{p}^{5} \Delta^{9 / 4} \leq \Delta^{-1 / 24}, \hat{p}^{5} \Delta^{2+1 / 2 m} \leq \Delta^{-15 / 56}$, and $C \hat{p}^{6} \Delta^{2+1 / m} \leq \Delta^{-17 / 84}$. Together with Claim 13, Corollary 6 now implies

\[

\]

### 4.4.2 Bound on $D_{2}$

We now bound $D_{2}$. We first prove that for any edge $u v w$,

$$
\begin{equation*}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mid \gamma_{w}(c)=1\right] \leq p_{u}(c) p_{v}(c)\left(1+1 / \omega_{0}\right) \tag{4.12}
\end{equation*}
$$

Assume that both $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$ are determined by (3.3). Since the function $\mathbf{I}[c \notin$ $L(u) \cup L(v)]$ is decreasing and $\mathbf{I}\left[\gamma_{w}(c)=1\right]$ is increasing, the FKG inequality implies

$$
\begin{align*}
\operatorname{Pr}\left[c \notin L(u) \cup L(v) \mid \gamma_{w}(c)=1\right] & =\frac{\operatorname{Pr}\left[c \notin L(u) \cup L(v), \gamma_{w}(c)=1\right]}{\operatorname{Pr}\left[\gamma_{w}(c)=1\right]} \\
& \leq \frac{\operatorname{Pr}[c \notin L(u) \cup L(v)] \operatorname{Pr}\left[\gamma_{w}(c)=1\right]}{\operatorname{Pr}\left[\gamma_{w}(c)=1\right]} \\
& =\operatorname{Pr}[c \notin L(u) \cup L(v)] . \tag{4.13}
\end{align*}
$$

Similarly,

$$
\begin{equation*}
\operatorname{Pr}\left[c \notin L(u) \mid \gamma_{w}(c)=1\right] \leq \operatorname{Pr}[c \notin L(u)] . \tag{4.14}
\end{equation*}
$$

If $c \in L(u)$ or $c \in L(v)$, then $p_{u}^{\prime}(c) p_{v}^{\prime}(c)=0$, so by (3.8),

$$
\begin{aligned}
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mid \gamma_{w}(c)=1\right] & \leq \frac{p_{u}(c)}{q_{u}(c)} \frac{p_{v}(c)}{q_{v}(c)} \operatorname{Pr}\left[c \notin L(u) \cup L(v) \mid \gamma_{w}(c)=1\right] \\
& \stackrel{(4.13)}{\leq} \frac{p_{u}(c)}{q_{u}(c)} \frac{p_{v}(c)}{q_{v}(c)} \operatorname{Pr}[c \notin L(u) \cup L(v)] \\
& \stackrel{(3.8)}{\leq} p_{u}(c) p_{v}(c)\left(1+1 / \omega_{0}\right) .
\end{aligned}
$$

Suppose $p_{u}^{\prime}(c)$ is determined by (3.3) and $p_{v}^{\prime}(c)$ is determined by (3.4). Then $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$ are independent of each other, and $p_{v}^{\prime}(c)$ is independent of the event $\gamma_{w}(c)=1$, so

$$
\begin{aligned}
& \mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mid \gamma_{w}(c)=1\right]=\mathbf{E}\left[p_{u}^{\prime}(c) \mid \gamma_{w}(c)=1\right] \mathbf{E}\left[p_{v}^{\prime}(c)\right] \\
& \stackrel{(3.5)}{=} \mathbf{E}\left[p_{u}^{\prime}(c) \mid \gamma_{w}(c)=1\right] p_{v}(c)
\end{aligned}
$$

$$
\begin{aligned}
& \leq \frac{p_{u}(c)}{q_{u}(c)} \operatorname{Pr}\left[c \notin L(u) \mid \gamma_{w}(c)=1\right] p_{v}(c) \\
& \stackrel{(4.14)}{\leq} \frac{p_{u}(c)}{q_{u}(c)} \operatorname{Pr}[c \notin L(u)] p_{v}(c) \\
& =p_{u}(c) p_{v}(c) \\
& <p_{u}(c) p_{v}(c)\left(1+1 / \omega_{0}\right) .
\end{aligned}
$$

If $p_{u}^{\prime}(c)$ and $p_{v}^{\prime}(c)$ are both determined by (3.4), then

$$
\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mid \gamma_{w}(c)=1\right]=\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c)\right]=\mathbf{E}\left[p_{u}^{\prime}(c)\right] \mathbf{E}\left[p_{v}^{\prime}(c)\right] \stackrel{(3,5)}{=} p_{u}(c) p_{v}(c),
$$

which establishes (4.12).
Now, by (4.12),

$$
\begin{aligned}
\mathbf{E}\left[D_{2}\right] & =\sum_{c \in C(u)} \sum_{u v w}\left(\mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mathbf{I}\left[\gamma_{w}(c)=1\right]\right]+\mathbf{E}\left[p_{u}^{\prime}(c) p_{w}^{\prime}(c) \mathbf{I}\left[\gamma_{v}(c)=1\right]\right]\right) \\
& =\sum_{c \in C(u)} \sum_{u v w} \mathbf{E}\left[p_{u}^{\prime}(c) p_{v}^{\prime}(c) \mid \gamma_{w}(c)=1\right] \operatorname{Pr}\left[\gamma_{w}(c)=1\right] \\
& +\sum_{c \in C(u)} \sum_{u v w} \mathbf{E}\left[p_{u}^{\prime}(c) p_{w}^{\prime}(c) \mid \gamma_{v}(c)=1\right] \operatorname{Pr}\left[\gamma_{v}(c)=1\right] \\
& \leq\left(1+1 / \omega_{0}\right) \sum_{c \in C(u)} \sum_{u v w}\left(p_{u}(c) p_{v}(c) \operatorname{Pr}\left[\gamma_{w}(c)=1\right]+p_{u}(c) p_{w}(c) \operatorname{Pr}\left[\gamma_{v}(c)=1\right]\right) \\
& =\left(1+1 / \omega_{0}\right) \sum_{c \in C(u)} \sum_{u v w}\left(p_{u}(c) p_{v}(c) \theta p_{w}(c)+p_{u}(c) p_{w}(c) \theta p_{v}(c)\right) \\
& =\left(1+1 / \omega_{0}\right) 2 \theta e_{u}
\end{aligned}
$$

We prove concentration of $D_{2}$ using the same setup that we used for $D_{1}$. Again, for $c \in C(u)$, let

$$
T_{c}=\left\{\gamma_{v}(c): v \in N(N(u))\right\} \cup\left\{\eta_{v}(c): v \in N(N(u))\right\} .
$$

Then $D_{2}$ is determined by the set of random variables $\left\{T_{c}: c \in C(u)\right\}$. Observe that

$$
\begin{aligned}
D_{2} & =\sum_{c \in C(u)} \sum_{l=0}^{m-1} \sum_{v \in N_{H}(u) \cap N^{0}(u, l)} \mathbf{I}\left[\gamma_{v}(c)=1\right] \sum_{w \in N_{H}(u, v)} p_{u}^{\prime}(c) p_{w}^{\prime}(c) \\
& :=\sum_{c \in C(u)} \sum_{l=0}^{m-1} \sum_{v \in N_{H}(u) \cap N^{0}(u, l)} D_{2}^{v, c} .
\end{aligned}
$$

Fix $c \in C(u)$. Let $x, x^{\prime} \in \mathcal{A}$ (from Claim 13) such that $x$ and $x^{\prime}$ differ only in coordinate c. Fix $l$ and $v \in N_{H}(u) \cap N^{0}(u, l)$. Note that for $d \in C(u)-c$,

$$
D_{2}^{v, d}(x)=D_{2}^{v, d}\left(x^{\prime}\right) .
$$

By definition of $\mathcal{A}_{c, l}$ (from Claim 13), $\mathbf{I}\left[\gamma_{v}(c)=1\right](x)=1$ or $\mathbf{I}\left[\gamma_{v}(c)=1\right]\left(x^{\prime}\right)=1$ for at most $2 \Delta^{1-l / 2 m} \hat{p}$ vertices $v \in N^{0}(u, l)$. Furthermore,

$$
\sum_{w \in N_{H}(u, v)} p_{u}^{\prime}(d) p_{w}^{\prime}(d) \leq d_{H}(u, v) \hat{p}^{2} .
$$

Thus

$$
\begin{aligned}
\left|D_{2}(x)-D_{2}\left(x^{\prime}\right)\right| & \leq \sum_{l=0}^{m-1} \sum_{\substack{ \\
v \in N_{H}(u) \cap N^{0}(u, l)}}\left|D_{2}^{v, c}(x)-D_{2}^{v, c}\left(x^{\prime}\right)\right| \\
& \leq \sum_{l=0}^{m-1} \sum_{\substack{v \in N_{H}(u) \cap N^{0}(u, l): \\
\mathbf{I}[v(c)=1](x)=1 \text { or } \\
\mathbf{I}\left[\gamma_{v}(c)=1\right] \mid\left(x^{\prime}\right)=1}} d_{H}(u, v) \hat{p}^{2} \\
& \leq \sum_{l=0}^{m-2}\left(2 \Delta^{1-l / 2 m} \hat{p}\right) \Delta^{(l+1) / 2 m} \hat{p}^{2}+\left(2 \Delta^{1-(m-1) / 2 m} \hat{p}\right) \delta \hat{p}^{2} \\
& <2 m \Delta^{1+1 / 2 m} \hat{p}^{3}+2 \delta \Delta^{1 / 2+1 / 2 m} \hat{p}^{3} .
\end{aligned}
$$

Recall that $\hat{p} \leq \Delta^{-11 / 24}$ and $\delta \leq \Delta^{6 / 10}((\mathrm{R} 7)$ and (R5)). Thus

$$
C\left(2 m \Delta^{1+1 / 2 m} \hat{p}^{3}+2 \delta \Delta^{1 / 2+1 / 2 m} \hat{p}^{3}\right)^{2} \leq \Delta^{1 / 2}\left(3 \Delta^{-211 / 840}\right)^{2} \leq 9 \Delta^{-1 / 420}
$$

By Corollary 6 and Claim 13,

$$
\begin{aligned}
\operatorname{Pr}\left[D_{2}>3 \theta e_{u}+1 / 2 \omega^{2}\right] & \leq \operatorname{Pr}\left[D_{2}>\left(1+1 / \omega_{0}\right) 2 \theta e_{u} / \operatorname{Pr}[\mathcal{A}]+1 / 2 \omega^{2}\right] \\
& \stackrel{\text { C.6 }}{\leq} e^{-2 /\left(4 \omega^{4} C\left(2 m \Delta^{1+1 / 2 m} \hat{p}^{3}+2 \delta \Delta^{1 / 2+1 / 2 m} \hat{p}^{3}\right)^{2}\right)}+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& \leq e^{-7 \log \Delta}+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& \stackrel{\text { c.13 }}{\leq} e^{-7 \log \Delta}+e^{-10 \log \Delta} \\
& \leq 2 e^{-7 \log \Delta} .
\end{aligned}
$$

Therefore, with probability at least $1-2 \Delta^{-5}$,

$$
\begin{aligned}
f_{u}^{\prime} & \leq f_{u}(1-\theta / 2)+1 / 2 \omega^{2}+3 \theta e_{u}+1 / 2 \omega^{2} \\
& \leq f_{u}(1-\theta / 2)+3 \theta e_{u}+1 / \omega^{2} .
\end{aligned}
$$

Proof of (Q5). Since

$$
d_{H}^{\prime}(u)=\frac{1}{2} \sum_{v \in N_{H}(u)} \sum_{w \in N_{H}(u, v)} \mathbf{I}\left[v, w \in U^{\prime}\right] \leq \frac{1}{2} \sum_{v \in N_{H}(u)} d_{H}(u, v) \mathbf{I}\left[v \in U^{\prime}\right],
$$

Claim 12 implies

$$
\mathbf{E}\left[d_{H}^{\prime}(u)\right] \leq \frac{1-3 \theta / 4}{2} \sum_{v \in N_{H}(u)} d_{H}(u, v)=(1-3 \theta / 4) d_{H}(u) .
$$

We prove concentration in the same way as in the proof of (Q3). For $c \in C(u)$, let

$$
T_{c}=\left\{\gamma_{v}(c): v \in N(N(u))\right\} \cup\left\{\eta_{v}(c): v \in N(N(u))\right\} .
$$

The random variable $d_{H}^{\prime}(u)$ is determined by the set of random variables $\left\{T_{c}: c \in C(u)\right\}$.
Observe that

$$
d_{H}^{\prime}(u) \leq \frac{1}{2} \sum_{l=0}^{m-1} \sum_{v \in N^{0}(u, l)} d_{H}^{0}(u, v) \mathbf{I}\left[v \in U^{\prime}\right] .
$$

Fix $c \in C(u)$. Let $x, x^{\prime} \in \mathcal{A}$ (from Claim 13) such that $x$ and $x^{\prime}$ differ only in coordinate $c$. Fix $l$. As in the proof of (Q3) (see the two paragraphs after (4.11)),

$$
\mathbf{I}\left[v \in U^{\prime}\right](x) \neq \mathbf{I}\left[v \in U^{\prime}\right]\left(x^{\prime}\right)
$$

for at most $2 \Delta^{1-l / 2 m} \hat{p}$ vertices $v \in N^{0}(u, l)$. Further, if $l \leq m-2$, then $d_{H}^{0}(u, v) \leq$ $\Delta^{(l+1) / 2 m}$, and if $l=m-1$, then $d_{H}^{0}(u, v) \leq \delta$. Therefore

$$
\begin{aligned}
\left|d_{H}^{\prime}(u)(x)-d_{H}^{\prime}(u)\left(x^{\prime}\right)\right| & \leq \sum_{l=0}^{m-2} \Delta^{1-l / 2 m} \hat{p} \Delta^{(l+1) / 2 m}+\Delta^{1-(m-1) / 2 m} \hat{p} \delta \\
& <m \Delta^{1+1 / 2 m} \hat{p}+\Delta^{1 / 2+1 / 2 m} \hat{p} \delta .
\end{aligned}
$$

By (R7) and (R5),

$$
C\left(m \Delta^{1+1 / 2 m} \hat{p}+\Delta^{1 / 2+1 / 2 m} \hat{p} \delta\right)^{2} \leq \Delta^{1 / 2}\left(2 \Delta^{559 / 840}\right)^{2}=4 \Delta^{769 / 420}
$$

By Corollary 6 and Claim 13,

$$
\begin{aligned}
\operatorname{Pr}\left[d_{H}^{\prime}(u)>(1-\theta / 2) d_{H}(u)+\Delta^{19 / 20}\right] & \leq \operatorname{Pr}\left[d_{H}^{\prime}(u)>(1-3 \theta / 4) d_{H}(u) / \operatorname{Pr}[\mathcal{A}]+\Delta^{19 / 20}\right] \\
& \stackrel{\leq}{\text { C.6 }} e^{-2 \Delta^{38 / 20} / C\left(m \Delta^{1+1 / 2 m} \hat{p}+\Delta^{1 / 2+1 / 2 m} \hat{p} \delta\right)^{2}}+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& \leq e^{-(1 / 2) \Delta^{38 / 20-769 / 420}}+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& \leq e^{-7 \log \Delta}+\operatorname{Pr}[\overline{\mathcal{A}}] \\
& \stackrel{\text { C.13 }}{\leq} e^{-7 \log \Delta}+e^{-10 \log \Delta} \\
& \leq 2 e^{-7 \log \Delta} .
\end{aligned}
$$

### 4.5 Final Step

After the iterative portion of the algorithm, some vertices will still be uncolored. Assuming (R1)-(R7) and Lemmas 8, 9, and 11 hold, we color them using the Asymmetric Local Lemma as follows. Suppose $u$ has not been colored. By (P1), Lemma 11, and (R4),

$$
\sum_{c \in C(u)-B^{T}(u)} p_{u}^{T}(c)=\sum_{c \in C(u)} p_{u}^{T}(c)-\sum_{c \in B^{T}(u)} p_{u}^{T}(c) \stackrel{(\mathrm{P} 1)}{\geq} 1-1 / \log C-\left|B^{T}(u)\right| \hat{p}
$$

$$
\begin{aligned}
& \stackrel{\mathrm{L}, 11}{\geq} 1-o(1)-\epsilon \\
& \stackrel{(\mathrm{RA})}{\geq} 1 / 2 .
\end{aligned}
$$

For each $c \notin B^{T}(u)$, define

$$
p_{u}^{*}(c):=\frac{p_{u}^{T}(c)}{\sum_{c \in C(u)-B^{T}(u)} p_{u}^{T}(c)} \leq 2 p_{u}^{T}(c) .
$$

For each uncolored vertex $u$, randomly assign $u$ one color from the distribution given by $p_{u}^{*}$. For an edge $e=u v w \in H^{T}$, let $A_{u v w}$ denote the event that $u, v$, and $w$ receive the same color. By definition of $T, T / \omega^{2}=o(\omega)$. So by (Q2),

$$
e_{u v w}^{T} \leq e_{u v w}^{0}+T / \Delta \omega^{2}=1 / C^{2}+o(\omega / \Delta)=\omega / \Delta+o(\omega / \Delta)
$$

Therefore

$$
\operatorname{Pr}\left[A_{u v w}\right]=\sum_{c \in C(u)} p_{u}^{*}(c) p_{v}^{*}(c) p_{w}^{*}(c) \leq 8 \sum_{c \in C(u)} p_{u}^{T}(c) p_{v}^{T}(c) p_{w}^{T}(c)=8 e_{u v w}^{T} \leq 9 \omega / \Delta .
$$

For each $c \in C(u) \cap C(v)$ and each pair $u v \in G_{c}^{T}$, let $B_{u v, c}$ denote the event that $u$ and $v$ both receive color $c$. By (P3), for each $u$,

$$
\sum_{c \in C(u)} \sum_{u x \in G_{c}^{T}} \operatorname{Pr}\left[B_{u x, c}\right] \leq 4 \sum_{c \in C(u)} \sum_{u x \in G_{c}^{T}} p_{u}^{T}(c) p_{x}^{T}(c)=4 f_{u}^{T} \leq 64(1-\theta / 4)^{T} \omega
$$

The event $A_{u v w}$ depends on any event $A_{e}$ or $B_{f, d}$, where $u, v$, or $w$ is in the edge $e$ or the edge $f$. Using (P5),

$$
\begin{aligned}
& \quad \sum_{e \in H^{T}: u \in e} \operatorname{Pr}\left[A_{e}\right]+\sum_{e \in H^{T}: v \in e} \operatorname{Pr}\left[A_{e}\right]+\sum_{e \in H^{T}: w \in e} \operatorname{Pr}\left[A_{e}\right] \\
& +\sum_{c \in C(u)} \sum_{u x \in G_{c}^{T}} \operatorname{Pr}\left[B_{u x, c}\right]+\sum_{c \in C(v)} \sum_{v x \in G_{c}^{T}} \operatorname{Pr}\left[B_{v x, c}\right] \sum_{c \in C(w)} \sum_{w x \in G_{c}^{T}} \operatorname{Pr}\left[B_{w x, c}\right] \\
& \leq 3(9 \omega / \Delta)(1-\theta / 3)^{T} \Delta+3(64)(1-\theta / 4)^{T} \omega \\
& \leq 219(1-\theta / 4)^{T} \omega \\
& \leq 219 e^{-\theta T / 4} \omega \\
& =219 e^{-5 \log \omega / 4} \omega \\
& =219\left(\frac{1}{\omega}\right)^{5 / 4} \omega \\
& <1 / 4
\end{aligned}
$$

The event $B_{u v, c}$ depends on any event $A_{e}$ or $B_{f, d}$, where $u$ or $v$ is in $e$ or $f$. Since

$$
\sum_{e \in H^{T}: u \in e} \operatorname{Pr}\left[A_{e}\right]+\sum_{e \in H^{T}: v \in e} \operatorname{Pr}\left[A_{e}\right]+\sum_{c \in C(u)} \sum_{u x \in G_{c}^{T}} \operatorname{Pr}\left[B_{u x, c}\right]+\sum_{c \in C(v)} \sum_{v x \in G_{c}^{T}} \operatorname{Pr}\left[B_{v x, c}\right]
$$

$$
\begin{aligned}
& \leq 18(1-\theta / 3)^{T} \omega+128(1-\theta / 4)^{T} \omega \\
& \leq 1 / 4
\end{aligned}
$$

the Asymmetric Local Lemma implies that there exists a coloring where none of the events $A_{u v w}$ or $B_{u v, c}$ occur. Since no color in $B^{T}(u)$ and no color with $p_{c}^{T}(u)=0$ was assigned to $u$, this coloring, combined with the partial coloring from the algorithm, is a proper list coloring of $H \cup G$.

## 5 Triangle-free hypergraphs

We will derive Theorem 2 as a corollary of the following theorem:
Theorem 14. Set $c_{0}=1 / 259,200$. Suppose $H$ is a rank 3, triangle-free hypergraph with maximum 3-degree at most $\Delta$, maximum 2-degree at most $\left(c_{0} \Delta \log \Delta\right)^{1 / 2}$, and maximum codegree at most $\Delta^{6 / 10}$. Then

$$
\chi_{l}(H) \leq\left(\frac{\Delta}{c_{0} \log \Delta}\right)^{1 / 2} .
$$

To prove this using Theorem 7, we need to find values for the parameters $\omega, \epsilon, \omega_{0}$, and $\hat{p}$ which satisfy (R1)-(R7), (3.6), (3.7), and (3.8), and $\omega=c_{0} \log \Delta$. We will show that the following values satisfy these criteria:

$$
\epsilon=1 / 72 \quad \omega=(1 / 24)(\epsilon / 150) \log \Delta \quad \hat{p}=\Delta^{-11 / 24} \quad \omega_{0}=1 / 19 \theta \hat{p}
$$

For (R1),

$$
\theta \log (\hat{p} C)=\frac{\epsilon}{\omega} \log \left(\frac{\Delta^{1 / 24}}{\sqrt{\omega}}\right)=\frac{\epsilon}{\omega}\left(\frac{1}{24} \log \Delta-\frac{1}{2} \log \omega\right)=86-o(1)>85 .
$$

The parameters clearly satisfy (R2)-(R7), so all that remains is to show inequalities (3.6), (3.7), and (3.8) hold. Fix a color $c$. In Claim 15, we first show that that hypergraph $H \cup G_{c}$ remains triangle-free throughout the algorithm. The next three claims then show that if the hypergraph remains triangle-free, we will have enough independence to derive (3.6), (3.7), and (3.8). Throughout the rest of this section, we will be taking intersections and unions over edges; when we do this, we use the notation $e$ in place of $e \in E(H) \cup E\left(G_{c}\right)$.

Claim 15. For iteration $i$, if $H^{i} \cup G_{c}^{i}$ is triangle-free, then $H^{i+1} \cup G_{c}^{i+1}$ is triangle-free.
Proof. It suffices to show that when the algorithm creates $G_{c}^{i+1}$ from $G_{c}^{i}$ by adding an edge $u v$ to $G_{c}^{i}$, no triangle is created. Toward a contradiction, suppose that a triangle
is created with distinct edges $u v, e, f \in H^{i+1} \cup G_{c}^{i+1}$ and distinct vertices $u, v, w$ such that $u \in e, v \in f, w \in e \cap f$, and $u \notin f, v \notin e$. Note that $u, v, w \in V\left(H^{i} \cup G_{c}^{i}\right)$ and $e, f \in H^{i} \cup G_{c}^{i}$. Since $w \in V\left(H^{i} \cup G_{c}^{i}\right)$, $w$ has not been colored. Thus there exists a vertex $x \in V\left(H^{i}\right)-w$ and an edge $u v x \in H^{i}$ which gave rise to the edge $u v$. The edges $u v x, e$, and $f$ form a triangle with vertices $u, v$, and $w$ in $H^{i}+G_{c}^{i}$, a contradiction.

In the rest of this section, we define

$$
d(u, v)=\left|\left\{e \in H \cup G_{c}: u, v \in e\right\}\right| .
$$

In addition, we drop the superscript from $H^{i}$ and $G_{c}^{i}$.
Claim 16. Suppose uvw $\in H, d(u, v) \geq 2$, and $d(w, v) \geq 2$. Then $d(u, w)=1$.
Proof. Since $d(u, v) \geq 2$ and $d(w, v) \geq 2$, there exist distinct edges $e, f \neq u v w$ such that $u, v \in e$ and $w, v \in f$. If there exists $x \neq v$ such that $u w x \in H$, then $e, f$, and $u x w$ form a triangle with corresponding vertices $u, v$, and $w$. If $u w \in G_{c}$, then $e, f$, and $u w$ form a triangle with vertices $u, v$, and $w$.

Claim 17. If uvw is an edge and $d(u, w)=1$, then

$$
\begin{align*}
& \left(\bigcup_{e: u \in e ; v \notin e} e-u\right) \cap\left(\bigcup_{e: w \in e ; v \notin e} e-w\right)=\emptyset  \tag{5.1}\\
& \left(\bigcup_{e: u \in e ; v \notin e} e-u\right) \cap\left(\bigcup_{e: v \in e ; u \notin e} e-v\right)=\emptyset \tag{5.2}
\end{align*}
$$

and

$$
\begin{equation*}
\left(\bigcup_{e: w \in e ; v \notin e} e-u\right) \cap\left(\bigcup_{e: v \in e ; w \notin e} e-v\right)=\emptyset . \tag{5.3}
\end{equation*}
$$

Proof. Let $x \in U$, and let $e$ be an edge such that $u \in e, v \notin e$, and $x \in e-u$. Then $e \neq u v w$, and since $d(u, w)=1, x \notin\{u, v, w\}$.

Suppose $f$ is an edge such that $w \in f, v \notin f$, and $x \in f-w$. Then, since $x \in f$, $f \neq u v w$. Using $d(u, w)=1, u \in e, w \in f$ and $e, f \neq u v w$, we get $e \neq f, u \notin f$, and $w \notin e$. Since $x \notin u v w$, we obtain a triangle with edges $e, f$, and $u v w$ and vertices $u, w$, and $x$.

Now suppose that $v, x \in f$ and $u \notin f$. Again, $f \neq u v w$. Because $u \in e$ and $u \notin f$, $e \neq f$. Since $u \notin f, v \notin e$, and $x \notin\{u, v, w\}, e, f$, and $u v w$ form a triangle with vertices $u, v$, and $x$. By symmetry, this also gives (5.3).

Claim 18. If $u v \in G_{c}$, then

$$
\begin{equation*}
\left(\bigcup_{e: u \in e ; v \notin e} e-u\right) \cap\left(\bigcup_{e: v \in e ; u \notin e} e-v\right)=\emptyset . \tag{5.4}
\end{equation*}
$$

Proof. If there exist edges $e$ and $f$ and a vertex $x$ such that $u \in e, v \notin e, v \in f, u \notin f$, and $x \in e-u \cap f-v$, then $e, f$, and $u v$ form a triangle with vertices $u$, $v$, and $x$ in $H \cup G_{c}$.

For a set of vertices $S$, let $\gamma_{S}(c)=1$ denote the event that $\gamma_{v}(c)=1$ for all $v \in S$, and let $\gamma_{S}(c) \neq 1$ denote the event that $\gamma_{v}(c)=0$ for some $v \in S$.

Claim 19. For any three vertices $x, y$, and $z$,

$$
\operatorname{Pr}\left[\bigcap_{e: x \in e ; y \notin e} \gamma_{e-x}(c) \neq 1\right] \leq \operatorname{Pr}\left[\bigcap_{e: x \in e ; y, z \notin e} \gamma_{e-x}(c) \neq 1\right] \leq q_{x}(c)(1+3 \theta \hat{p}) .
$$

Proof. Note first that

$$
\operatorname{Pr}\left[\bigcap_{e: x \in e ; y \in e} \gamma_{e-x}(c) \neq 1\right] \geq \operatorname{Pr}\left[\gamma_{y}(c)=0\right] \geq 1-\theta \hat{p}
$$

Similarly,

$$
\operatorname{Pr}\left[\bigcap_{e: x \in e ; z \in e} \gamma_{e-x}(c)\right] \geq 1-\theta \hat{p}
$$

Since the functions $\mathbf{I}\left[\bigcap_{x \in e ; y \notin e} \gamma_{e-x}(c) \neq 1\right]$ and $\mathbf{I}\left[\bigcap_{x \in e ; y \in e} \gamma_{e-x}(c) \neq 1\right]$ are monotone decreasing, the FKG inequality and then the previous two inequalities yield

$$
\begin{aligned}
q_{x}(c) & =\operatorname{Pr}\left[\bigcap_{e: x \in e ; y, z \notin e} \gamma_{e-x}(c) \neq 1 \bigcap_{e: x, y \in e} \gamma_{e-x}(c) \neq 1 \bigcap_{e: x, z \in e} \gamma_{e-x}(c) \neq 1\right] \\
& \geq \operatorname{Pr}\left[\bigcap_{e: x \in e ; y, z \notin e} \gamma_{e-x}(c) \neq 1\right] \operatorname{Pr}\left[\bigcap_{e: x \in e, y \in e} \gamma_{e-x}(c) \neq 1\right] \operatorname{Pr}\left[\bigcap_{e: x \in e, z \in e} \gamma_{e-x}(c) \neq 1\right] \\
& \geq \operatorname{Pr}\left[\bigcap_{e: x \in e ; y, z \notin e} \gamma_{e-x}(c) \neq 1\right](1-\theta \hat{p})^{2} \\
& \geq \operatorname{Pr}\left[\bigcap_{e: x \in e ; y, z \notin e} \gamma_{e-x}(c) \neq 1\right](1-2 \theta \hat{p}) .
\end{aligned}
$$

Thus

$$
\operatorname{Pr}\left[\bigcap_{e: x \in e ; y, z \notin e} \gamma_{e-x}(c) \neq 1\right] \leq q_{x}(c) /(1-2 \theta \hat{p}) \leq q_{x}(c)(1+3 \theta \hat{p}) .
$$

We can now prove (3.6), (3.7), and (3.8). Suppose $u v w$ is an edge. By Claim 16, we may assume $d(u, w)=1$. The events $\bigcap_{u \in e ; v \notin e} \gamma_{e-u}(c) \neq 1, \bigcap_{w \in e ; v \notin e} \gamma_{e-w}(c) \neq 1$, and $\bigcap_{v \in e ; u, w \notin e} \gamma_{e-v}(c) \neq 1$ depend only on the sets of random variables

$$
\begin{gathered}
\left\{\gamma_{x}(c): x \in \bigcup_{e: u \in e ; v \notin e} e-u\right\}, \\
\left\{\gamma_{x}(c): x \in \bigcup_{e: w \in e ; v \notin e} e-w\right\},
\end{gathered}
$$

and

$$
\left\{\gamma_{x}(c): x \in \bigcup_{e: v \in e ; u, w \notin e} e-v\right\}
$$

respectively. By (5.1), (5.2), and (5.3), these sets are pairwise disjoint, so the three events are independent of each other. Therefore, applying Claim 19,

$$
\begin{aligned}
& \operatorname{Pr}[c \notin L(u) \cup L(v) \cup L(w)] \\
& =\operatorname{Pr}\left[\bigcap_{e: u \in e} \gamma_{e-u}(c) \neq 1 \bigcap_{e: v \in e} \gamma_{e-v}(c) \neq 1 \bigcap_{e: w \in e} \gamma_{e-w}(c) \neq 1\right] \\
& \leq \operatorname{Pr}\left[\bigcap_{e: u \in e ; v \notin e} \gamma_{e-u}(c) \neq 1 \bigcap_{e: v \in e ; u, w \notin e} \gamma_{e-v}(c) \neq 1 \bigcap_{e: w \in e ; v \notin e} \gamma_{e-w}(c) \neq 1\right] \\
& =\operatorname{Pr}\left[\bigcap_{e: u \in e: v \notin e} \gamma_{e-u}(c) \neq 1\right] \operatorname{Pr}\left[\bigcap_{e: v \in e ; u, w \notin e} \gamma_{e-v}(c) \neq 1\right] \operatorname{Pr}\left[\bigcap_{e: w \in e ; v \notin e} \gamma_{e-w}(c) \neq 1\right] \\
& \stackrel{\text { C.19 }}{\leq} q_{u}(c) q_{v}(c) q_{w}(c)(1+3 \theta \hat{p})^{3} \\
& <q_{u}(c) q_{v}(c) q_{w}(c)(1+19 \theta \hat{p}) \\
& =q_{u}(c) q_{v}(c) q_{w}(c)\left(1+1 / \omega_{0}\right) .
\end{aligned}
$$

This proves (3.6). The proof of (3.7) is the same, except we start with any two vertices in $u v w$ instead of all three.

Suppose now that $u v \in G_{c}$ for some color $c$. By (5.4) and Claim 19,

$$
\begin{aligned}
\operatorname{Pr}[c \notin L(u) \cup L(v)] & =\operatorname{Pr}\left[\bigcap_{e: u \in e} \gamma_{e-u}(c) \neq 1 \bigcap_{e: v \in e} \gamma_{e-v}(c) \neq 1\right] \\
& \leq \operatorname{Pr}\left[\bigcap_{e: u \in e ; v \notin e} \gamma_{e-u}(c) \neq 1 \bigcap_{e: v \in e: u \notin e} \gamma_{e-v}(c) \neq 1\right] \\
& \stackrel{(5.4)}{=} \operatorname{Pr}\left[\bigcap_{e: u \in e: v \notin e} \gamma_{e-u}(c) \neq 1\right] \operatorname{Pr}\left[\bigcap_{e: v \in e ; u \notin e} \gamma_{e-v}(c) \neq 1\right] \\
& \stackrel{\text { C.19 }}{\leq} q_{u}(c) q_{v}(c)(1+3 \theta \hat{p})^{2} \\
& <q_{u}(c) q_{v}(c)(1+7 \theta \hat{p}) \\
& <q_{u}(c) q_{v}(c)\left(1+1 / \omega_{0}\right)
\end{aligned}
$$

completing the proof of (3.8) and Theorem 14.
Proof of Theorem 2: Recall that $c_{0}=1 / 259,200$. Let $H$ be a rank 3, trianglefree hypergraph with maximum 3-degree $\Delta$ and maximum 2-degree $\Delta_{2}$. The original hypergraph $H$ may have some pairs of vertices with codegree too large to apply Theorem 14 , so we will work on a modified hypergraph instead. Let

$$
K(u)=\left\{v \in N(u): d(u, v) \geq \Delta^{6 / 10}\right\} .
$$

Define a new hypergraph $H^{\prime}$ with $V\left(H^{\prime}\right)=V(H)$ and

$$
E\left(H^{\prime}\right)=E(H)-\left(\bigcup_{u \in V(H)} \bigcup_{v \in K(u)}\{e: u, v \in e\}\right)+\left(\bigcup_{u \in V(H)} \bigcup_{v \in K(u)}\{u, v\}\right)
$$

Let $\Delta^{\prime}, \Delta_{2}^{\prime}$, and $\delta^{\prime}$ denote the maximum 3-degree, maximum 2-degree, and maximum codegree of $H^{\prime}$, respectively. Note that $H^{\prime}$ is still triangle-free, $\chi_{l}(H) \leq \chi_{l}\left(H^{\prime}\right), \delta^{\prime} \leq$ $\Delta^{6 / 10}$, and $\Delta^{\prime} \leq \Delta$.

Suppose $\Delta_{2}^{\prime} \leq \sqrt{\Delta} \sqrt{c_{0} \log \Delta}$. Since $\Delta^{\prime} \leq \Delta$ and $\delta^{\prime} \leq \Delta^{6 / 10}$, Theorem 14 implies

$$
\chi_{l}(H) \leq \chi_{l}\left(H^{\prime}\right) \leq\left(\frac{\Delta}{c_{0} \log \Delta}\right)^{1 / 2}
$$

On the other hand, suppose $\Delta_{2}^{\prime}>\sqrt{\Delta} \sqrt{c_{0} \log \Delta}$. Then, since

$$
\Delta \geq d_{H}(u) \geq \frac{1}{2} \sum_{v \in N_{H}(u)} d_{H}(u, v) \geq \frac{1}{2} \sum_{\substack{v \in N_{H}(u) \\ d_{H}(u, v) \geq \Delta^{6 / 10}}} d_{H}(u, v) \geq|K(u)| \Delta^{6 / 10} / 2,
$$

we have

$$
\Delta_{2}^{\prime} \leq \Delta_{2}+2 \Delta^{4 / 10}<\Delta_{2}+\Delta_{2}^{\prime} / 2
$$

Choose $\Delta^{\prime \prime}$ so that $\Delta_{2}^{\prime}=\sqrt{\Delta^{\prime \prime}} \sqrt{c_{0} \log \Delta^{\prime \prime}}$. Since $\Delta_{2}^{\prime}>\sqrt{\Delta} \sqrt{c_{0} \log \Delta}, \Delta^{\prime \prime}>\Delta$. Then the maximum 3-degree of $H^{\prime}$ is at most $\Delta<\Delta^{\prime \prime}$, the maximum 2-degree of $H^{\prime}$ is at most $\Delta_{2}^{\prime} \leq \sqrt{\Delta^{\prime \prime}} \sqrt{c_{0} \log \Delta^{\prime \prime}}$, and the maximum codegree of $H^{\prime}$ is at most $\Delta^{6 / 10}<\Delta^{1 / 6 / 10}$, so Theorem 14 implies

$$
\chi_{l}(H) \leq \chi_{l}\left(H^{\prime}\right) \leq\left(\frac{\Delta^{\prime \prime}}{c_{0} \log \Delta^{\prime \prime}}\right)^{1 / 2}=\frac{\Delta_{2}^{\prime}}{c_{0} \log \Delta^{\prime \prime}}<\frac{\Delta_{2}^{\prime}}{c_{0} \log \Delta_{2}^{\prime}}<\frac{2 \Delta_{2}}{c_{0} \log 2 \Delta_{2}} .
$$

## 6 Acknowledgments

We would like to thank the referees for their feedback, particularly in helping us to improve the readability of the proof of (Q3).
