

1. (**20 points total**) The number of  $m$ -element subset of an  $n$ -element set, where  $0 \leq m \leq n$ , is  $\binom{n}{m} = \frac{n!}{m!(n-m)!}$ .

(a)  $\binom{10}{6} = \frac{10!}{6!4!} = \frac{10 \cdot 9 \cdot 8 \cdot 7}{4 \cdot 3 \cdot 2 \cdot 1} = 10 \cdot 3 \cdot 7 = 210$ . (**3 points**)

(b) Since two particular individuals are to be included on the committee, these committees are formed by choosing  $6 - 2 = 4$  from the remaining  $10 - 2 = 8$ . Thus the number is  $\binom{10-2}{6-2} = \binom{8}{4} = \frac{8!}{4!4!} = \frac{8 \cdot 7 \cdot 6 \cdot 5}{4 \cdot 3 \cdot 2 \cdot 1} = 7 \cdot 2 \cdot 5 = 70$ . (**3 points**)

(c) Since two particular individuals are to be excluded from the committee, these committees are formed by choosing 6 from the remaining  $10 - 2 = 8$ . Thus the number is  $\binom{10-2}{6} = \binom{8}{6} = \frac{8!}{6!2!} = \frac{8 \cdot 7}{2 \cdot 1} = 4 \cdot 7 = 28$ . (**3 points**)

(d) See part (c). Thus the number is  $\binom{10-1}{6} = \binom{9}{6} = \frac{9!}{6!3!} = \frac{9 \cdot 8 \cdot 7}{3 \cdot 2 \cdot 1} = 3 \cdot 4 \cdot 7 = 84$ . (**3 points**)

(e) Let  $X$  be the set of committees of 6 with the first individual excluded and  $Y$  be the set of committees of 6 with the second excluded. Then  $X \cup Y$  is the set of committees with one or the other excluded and  $X \cap Y$  is the set of committees with both excluded. Thus

$$|X \cup Y| = |X| + |Y| - |X \cap Y| \quad (\mathbf{4 \text{ points}}) = 84 + 84 - 28 = 140. \quad (\mathbf{4 \text{ points}})$$

2. (**20 points total**) This exercise is best done by systematic listings.

(a) Isomorphisms  $f : \{3, 5, 7\} \longrightarrow \{3, 5, 7\}$ :

$$\begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_1(x) & 3 & 5 & 7 \end{array} \qquad \begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_2(x) & 3 & 7 & 5 \end{array}$$

$$\begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_3(x) & 5 & 3 & 7 \end{array} \qquad \begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_4(x) & 5 & 7 & 3 \end{array}$$

$$\begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_5(x) & 7 & 3 & 5 \end{array} \qquad \begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_6(x) & 7 & 5 & 3 \end{array}$$

Note that each of these functions is its own inverse, except for  $f_4$  and  $f_5$  which are inverses of each other. **(8 points)**

(b) Surjections  $f : \{3, 5, 7\} \longrightarrow \{a, b\}$ :

$$\begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_1(x) & a & b & b \end{array} \qquad \begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_2(x) & b & a & b \end{array} \qquad \begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_3(x) & b & b & a \end{array}$$

$$\begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_4(x) & b & a & a \end{array} \qquad \begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_5(x) & a & b & a \end{array} \qquad \begin{array}{c|ccc} x & 3 & 5 & 7 \\ \hline f_6(x) & a & a & b \end{array}$$

**(6 points)**

(c) Injections  $f : \{a, b\} \longrightarrow \{3, 5, 7\}$ :

$$\begin{array}{c|cc} x & a & b \\ \hline f_1(x) & 3 & 5 \end{array} \qquad \begin{array}{c|cc} x & a & b \\ \hline f_2(x) & 3 & 7 \end{array}$$

$$\begin{array}{c|cc} x & a & b \\ \hline f_3(x) & 5 & 3 \end{array} \qquad \begin{array}{c|cc} x & a & b \\ \hline f_4(x) & 5 & 7 \end{array}$$

$$\begin{array}{c|cc} x & a & b \\ \hline f_5(x) & 7 & 3 \end{array} \qquad \begin{array}{c|cc} x & a & b \\ \hline f_6(x) & 7 & 5 \end{array}$$

**(6 points)**

3. **(20 points total)** Let  $X$  be the set of residents of this small town.

(a) For  $x \in X$  let  $f(x)$  be the number of denominations resident  $x$  is carrying. Then  $f(x) \in \{0, 1, \dots, 6\}$  as there are 6 denominations. The question can be rephrased as how large does  $|X|$  have to be to guarantee that  $f(x_1) = f(x_2)$  for some  $x_1 \neq x_2$ ; that is for  $f$  not to be injective. Answer:  $|X| > 7$ . **(10 points)**

(b) Let  $f(x)$  be the set of types of denominations resident  $x$  is carrying. Then  $f(x) \in P(\{\$1, \$5, \$10, \$20, \$50, \$100\})$  which has  $2^6 = 64$  elements. In light of the solution to part (a),  $|X| > 64$ . **(10 points)**

4. **(20 points total)**  $f$  is surjective. Suppose  $n \in \mathbf{Z}^+$ . If  $n = 2m$  for some  $m \in \mathbf{Z}$ , then  $m > 0$  and thus  $f(m) = 2m = n$  by definition of  $f$ . If  $n = 2m + 1$  for some  $m \in \mathbf{Z}$ , then  $m \geq 0$  which means  $-m \leq 0$  and  $f(-m) = -2(-m) + 1 = 2m + 1 = n$  by definition of  $f$ . We have shown that  $f$  is surjective. **(8 points)**

$f$  is injective. Let  $n, n' \in \mathbf{Z}$  and suppose that  $f(n) = f(n')$ .

*Case 1:*  $f(n)$  is even. Then so is  $f(n')$  and thus  $n, n' > 0$  and  $2n = f(n) = f(n') = 2n'$ . But  $2n = 2n'$  implies  $n = n'$ . **(6 points)**

*Case 2:*  $f(n)$  is not even. Consequently  $f(n)$  is odd. Then so is  $f(n')$  and thus  $n, n' \leq 0$  and  $-2n + 1 = f(n) = f(n') = -2n' + 1$ . But then  $2(-n) + 1 = 2(-n') + 1$  which implies  $n = n'$ . **(6 points)**

We have shown in all cases that  $f(n) = f(n')$  implies  $n = n'$ . Therefore  $f$  is injective.

5. **(20 points total)** The Principle of Inclusion-Exclusion: If  $X, Y$  are finite sets then  $|X \cup Y| = |X| + |Y| - |X \cap Y|$ .

(a) Using DeMorgan's Law  $|A^c \cap B^c| = |(A \cup B)^c| = |U| - |A \cup B|$ . **(4 points)** Since  $|A \cup B| = |A| + |B| - |A \cap B| = 8 + 7 - 3 = 12$  **(4 points)** and  $|U| = 21$ ,  $|A^c \cap B^c| = 21 - 12 = 9$ . **(2 points)**

(b) Let  $S$  and  $C$  be the sets of square tiles and circular tiles respectively, and let  $R$  and  $G$  be the sets of red tiles and green tiles respectively. Let  $U$  be the set of tiles. Then  $S \cup C = U = G \cup R$  and these are disjoint unions. Thus by the Addition Principle (a special case of the Inclusion-Exclusion Principle)

$$|S| + |C| = |U| = |G| + |R|.$$

Since we are given that  $|U| = 22$ ,  $|S| = 9$ , and  $|R| = 11$ , we conclude that  $|C| = 13$  and  $|G| = 11$ .

(i)  $|S \cup G| = |S| + |G| - |S \cap G| = 9 + 11 - 6 = 14$  **(3 points)** as  $|S \cap G| = 6$  (given).

(ii)  $S = (S \cap G) \cup (S \cap R)$  and is a disjoint union. Therefore

$$|S| = |S \cap G| + |S \cap R|,$$

or  $9 = 6 + |S \cap R|$  which means  $|S \cap R| = 3$ .

Now  $R = (R \cap S) \cup (R \cap C)$  and is a disjoint union. Therefore

$$|R| = |S \cap R| + |C \cap R|,$$

or  $11 = 3 + |C \cap R|$  which means  $|C \cap R| = 8$ . (**3 points**)

(iii)  $|C \cup R| = |C| + |R| - |C \cap R| = 13 + 11 - 8 = 16$ . (**4 points**)
