# Does There Exist an Elliptic Curve $E / \mathbb{Q}$ with Mordell-Weil Group $Z_{2} \times Z_{8} \times \mathbb{Z}^{4}$ ? 

Edray Herber Goins<br>Department of Mathematics, Purdue University<br>Atkin Memorial Lecture and Workshop:<br>Elliptic Curves over $\mathbb{Q}(\sqrt{5})$<br>April 29, 2012<br>PuRDUE<br>U N I V E R S I T Y

## Abstract

An elliptic curve $E$ defined over the rational numbers $\mathbb{Q}$ is an arithmetic-algebraic object: It is simultaneously a nonsingular projective curve with an affine equation $Y^{2}=X^{3}+A X+B$, which allows one to perform arithmetic on its points; and a finitely generated abelian group $E(\mathbb{Q}) \simeq E(\mathbb{Q})_{\text {tors }} \times \mathbb{Z}^{r}$, which allows one to apply results from abstract algebra. The abstract nature of its rank $r$ can be made explicit by searching for rational points $(X, Y)$.

The largest possible subgroup of an elliptic curve $E$ is $E(\mathbb{Q})_{\text {tors }} \simeq Z_{2} \times Z_{8}$, and, curiously, these curves seem to have the least known information about the rank $r$. To date, there are twenty-seven known examples of elliptic curves over $\mathbb{Q}$ having Mordell-Weil group $E(\mathbb{Q}) \simeq Z_{2} \times Z_{8} \times \mathbb{Z}^{3}$, yet no larger rank has been found.

In this talk, we give some history on the problem of determining properties of $r$ and analyze various approaches to finding curves of large rank.

## Outline of Talk

(1) Motivation

- Challenge Problem
- Elliptic Integrals
- Addition Formulas
(2) Elliptic Curves
- Mordell-Weil Group
- Are the ranks unbounded?
- $Z_{2} \times Z_{4}$ and $Z_{2} \times Z_{8}$
(3) Ranks of $y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)$
- Examples
- Lower Bounds
- 2-Descent

## Challenge Problem

$$
E: y^{2}=x^{3}+(5-\sqrt{5}) x^{2}+\sqrt{5} x
$$

- The curve has invariant $j(E)=86048-38496 \sqrt{5}$.
- The curve has conductor $\mathfrak{f}_{E}=\mathfrak{p}_{2}^{6} \mathfrak{p}_{5}^{2}$ in terms of the prime ideals $\mathfrak{p}_{2}=2 \mathbb{Z}[\varphi]$ and $\mathfrak{p}_{5}=\sqrt{5} \mathbb{Z}[\varphi]$, where $\varphi=\frac{1+\sqrt{5}}{2}$.
- This curve is 2 -isogeneous to (a quadratic twist of) its Galois conjugate.

## Theorem (G-, 1999)

The elliptic curve $E$ is modular. More precisely, there is a modular form $f(q) \in S_{2}\left(\Gamma_{0}(160), \epsilon\right)$ and a Dirichlet character $\chi: \mathbb{Z}[\varphi] \rightarrow \mathbb{C}$ such that $\chi^{2}=\epsilon \circ \mathbb{N}_{\mathbb{Q}(\sqrt{5}) / \mathbb{Q}}$ and $a_{\mathfrak{p}}(f)=\chi(\mathfrak{p}) a_{\mathfrak{p}}(E)$ for almost all primes $\mathfrak{p}$.

## Challenge

Compute the Mordell-Weil group $E(\mathbb{Q}(\sqrt{5}))$ before the end of this talk!

## My Favorite Elliptic Curve:

$$
y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)
$$

## Theorem (Galileo Galilei, 1602; Christiaan Huygens, 1673)

Say we have a mass $m$ attached to a rigid rod of length $\ell$ that is allowed to swing back and forth at one end. The period of the oscillation, given an initial angle $\theta_{0}$, is

$$
\text { Period }=4 \sqrt{\frac{\ell}{g}} \cdot K\left(\sin \frac{\theta_{0}}{2}\right)=2 \pi \sqrt{\frac{\ell}{g}}\left[1+\frac{1}{4} \sin ^{2} \frac{\theta_{0}}{2}+\cdots\right]
$$

in terms of the complete elliptic integral of the first kind:

$$
K(k)=\int_{0}^{1} \frac{d t}{\sqrt{\left(1-t^{2}\right)\left(1-k^{2} t^{2}\right)}}=\frac{\pi}{2} \sum_{n=0}^{\infty}\left[\frac{(2 n-1)!!}{(2 n)!!}\right]^{2} k^{2 n} .
$$

## Theorem (Jakob Bernoulli, 1694)

The circumference of the lemniscus $\left(x^{2}+y^{2}\right)^{2}=a^{2}\left(x^{2}-y^{2}\right)$ is

$$
\text { Arc Length }=4 a \cdot K(\sqrt{-1})=2 \pi a \sum_{n=0}^{\infty}(-1)^{n}\left[\frac{(2 n-1)!!}{(2 n)!!}\right]^{2} \text {. }
$$

## Theorem (Giulio Fagnano, 1718)

Define $w=w(z)$ implicitly via $z=\int_{0}^{w} \frac{d t}{\sqrt{1-t^{4}}}$. Then

$$
w(2 z)=\frac{2 w(z) w^{\prime}(z)}{1+w(z)^{4}} \quad \text { where } \quad w^{\prime}(z)=\sqrt{1-w(z)^{4}}
$$

## Theorem (Leonhard Euler, 1751)

Fix a modulus $k$ satisfying $|k|<1$, and define $w=w(z)$ implicitly via the incomplete elliptic integral $z=\int_{0}^{w} \frac{d t}{\sqrt{\left(1-t^{2}\right)\left(1-k^{2} t^{2}\right)}}$. Then

$$
w(z \pm \xi)=\frac{w(z) w^{\prime}(\xi) \pm w^{\prime}(z) w(\xi)}{1-k^{2} w(z)^{2} w(\xi)^{2}}
$$

where $w^{\prime}(z)=\sqrt{\left[1-w(z)^{2}\right]\left[1-k^{2} w(z)^{2}\right]}$.
Remark: $w(z)=\operatorname{sn}(z)$ is a Jacobi elliptic function.

## Theorem

- The Jacobi elliptic function sn: $\mathbb{C} / \Lambda \rightarrow \mathbb{C}$ is well-defined modulo the period lattice $\Lambda=\left\{m \omega_{1}+n \omega_{2} \mid m, n \in \mathbb{Z}\right\}$ in terms of the integrals

$$
\begin{aligned}
& \omega_{1}=2 \int_{-1 / k}^{1 / k} \frac{d t}{\sqrt{\left(1-t^{2}\right)\left(1-k^{2} t^{2}\right)}}=\frac{4}{k} \cdot K\left(\frac{1}{k}\right) \\
& \omega_{2}=2 \int_{-1}^{1} \frac{d t}{\sqrt{\left(1-t^{2}\right)\left(1-k^{2} t^{2}\right)}}=4 \cdot K(k)
\end{aligned}
$$

- The map $\mathbb{C} / \Lambda \rightarrow \mathbb{C}^{2}$ which sends $z \mapsto\left(\operatorname{sn}(z), \operatorname{sn}^{\prime}(z)\right)$ parametrizes all points $(x, y)$ on the quartic curve $y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)$. Moreover, $0 \mapsto(0,1)$.
- Say that $P=\left(\operatorname{sn}(z), \operatorname{sn}^{\prime}(z)\right)$ and $Q=\left(\operatorname{sn}(\xi), \operatorname{sn}^{\prime}(\xi)\right)$ are on the quartic curve. Then $P \oplus Q=\left(\operatorname{sn}(z+\xi), \operatorname{sn}^{\prime}(z+\xi)\right)$ has coordinate

$$
x(P \oplus Q)=\frac{x(P) y(Q) \pm y(P) x(Q)}{1-k^{2} x(P)^{2} x(Q)^{2}} .
$$

## Proposition

$y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)$ is a quadric intersection in $\mathbb{P}^{3}$ and has a Weierstrass model in $\mathbb{P}^{2}$. It is nonsingular if and only if $k \neq-1,0,1$.

$$
\begin{aligned}
& y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right) \\
& x_{2}^{2}=\left(x_{3}-x_{0}\right)\left(k^{2} x_{3}-x_{0}\right) \\
& x_{1}^{2}=x_{3} x_{0}
\end{aligned}
$$

$$
(x, y)=\left(\frac{x_{1}}{x_{0}}, \frac{x_{2}}{x_{0}}\right)
$$

$$
\left(x_{1}: x_{2}: x_{3}: x_{0}\right)
$$

$$
\begin{aligned}
Y^{2} Z & =X^{3}+A X Z^{2}+B Z^{3} \\
A & =-27\left(k^{4}+14 k^{2}+1\right) \\
B & =-54\left(k^{6}-33 k^{4}-33 k^{2}+1\right)
\end{aligned}
$$

$$
\frac{X}{Z}=\frac{3\left(5 k^{2}-1\right) x+3\left(k^{2}-5\right)}{x-1}
$$

$$
\frac{Y}{Z}=\frac{54\left(1-k^{2}\right) y}{(x-1)^{2}}
$$

## Elliptic Curves

More generally, we consider cubic curves

$$
E: \quad Y^{2}=X^{3}+A X+B
$$

where the rational numbers $A$ and $B$ satisfy $4 A^{3}+27 B^{2} \neq 0$.

Given a field $K$ such as either $\mathbb{Q}, \mathbb{R}, \mathbb{C}$, or even $\mathbb{Q}(\sqrt{5})$, denote

$$
E(K)=\left\{(X: Y: Z) \in \mathbb{P}^{2}(K) \mid Y^{2} Z=X^{3}+A X Z^{2}+B Z^{3}\right\}
$$

Remark: $\mathcal{O}=(0: 1: 0)$ comes from $(x, y)=(1,0)-\operatorname{not}(x, y)=(0,1)$ !

## Mordell-Weil Group

## Conjecture (Henri Poincaré, 1901)

Let $E$ be an elliptic curve over $\mathbb{Q}$. Then $E(\mathbb{Q})$ is a finitely generated abelian group.

## Theorem (Louis Mordell, 1922; André Weil, 1928)

Let $E$ be an elliptic curve over a number field $K$. There exists a group $E(K)_{\text {tors }}$ and a nonnegative integer $r$ such that $E(K) \simeq E(K)_{\text {tors }} \times \mathbb{Z}^{r}$.

## Theorem (Barry Mazur, 1977)

The torsion subgroup of an elliptic curve $E$ over $\mathbb{Q}$ is one of fifteen types:

$$
E(\mathbb{Q})_{\mathrm{tors}} \simeq \begin{cases}Z_{N} & \text { for } 1 \leq N \leq 10 \text { or } N=12 \\ Z_{2} \times Z_{2 N} & \text { for } 1 \leq N \leq 4\end{cases}
$$

Question: What can one say about the Mordell-Weil rank $r=r(E)$ ?

## Rank Conjecture

## Conjecture

Let $T$ be one of the fifteen torsion groups in Mazur's Theorem. For any given nonnegative integer $r_{0}$, there exists an elliptic curve $E$ over $\mathbb{Q}$ with torsion subgroup $E(\mathbb{Q})_{\text {tors }} \simeq T$ and Mordell-Weil rank $r(E) \geq r_{0}$.

## Project

Given $T$ and $r_{0}$, find an elliptic curve $E$ over with torsion subgroup $E(\mathbb{Q})_{\text {tors }} \simeq T$ and Mordell-Weil rank $r(E) \geq r_{0}$.

For each torsion group $T$, define the quantity

$$
B(T)=\sup \left\{r \in \mathbb{Z} \mid \text { there exists a curve } E \text { with } E(\mathbb{Q}) \simeq T \times \mathbb{Z}^{r}\right\} .
$$

Question: Is $B(T)$ unbounded?

## Competing Points of View

## Conjecture (Taira Honda, 1960)

If $E$ is an elliptic curve defined over $\mathbb{Q}$, and $K$ is a number field, then the ratio of the Mordell-Weil rank of $E(K)$ to the degree $[K: \mathbb{Q}]$ should be uniformly bounded by a constant depending only on $E$.

Remark: If true, this would imply that there are infinite families of elliptic curves over the rational numbers which have a uniformly bounded rank.

## Theorem (Igor Shafarevich and John Tate, 1967)

The ranks are not uniformly bounded for elliptic curves defined over function fields $\mathbb{F}_{q}(t)$.

## Classification

## Theorem

Fix a rational $k \neq-1,0,1$ for the curve $E_{k}: y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)$.

- $E_{k}(\mathbb{Q})_{\text {tors }} \simeq\left\{\begin{array}{ll}Z_{2} \times Z_{8} & \text { if } k=\frac{t^{4}-6 t^{2}+1}{\left(t^{2}+1\right)^{2}} \\ Z_{2} \times Z_{4} & \text { otherwise. }\end{array}\right.$ for some rational $t$,
- Conversely, if $E$ is an elliptic curve over $K$ with torsion subgroup $E(\mathbb{Q})_{\text {tors }} \simeq Z_{2} \times Z_{4}$ or $Z_{2} \times Z_{8}$, then $E \simeq E_{k}$ for some $k \in K$.
- The modular curve $X_{0}(24): Y^{2}=X^{3}+5 X^{2}+4 X$ has Mordell-Weil group $X_{0}(24)(\mathbb{Q}) \simeq Z_{2} \times Z_{4}$, and so corresponds to $k=1 / 3$.
- The modular curve $X_{1}(15): Y^{2}+X Y+Y=X^{3}+X^{2}-10 X-10$ has $X_{1}(15)(\mathbb{Q}) \simeq Z_{2} \times Z_{4}$, and so corresponds to $k=1 / 9$. Moreover, $X_{1}(15)(\mathbb{Q}(\sqrt{5})) \simeq Z_{2} \times Z_{8}$, and so $t=(3-\sqrt{5}) / 2$.

$$

## Example

On the quartic curve $y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)$, the rational point $(x, y)$ has order 2 if and only if $[2](x, y)=(1,0)$. There are only four:

$$
\left(\frac{1}{k}, 0\right), \quad(1,0), \quad(-1,0), \quad \text { and } \quad\left(-\frac{1}{k}, 0\right) .
$$

## Example

On the quartic curve $y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)$, the rational point $(x, y)$ has order 4 if and only if $[2](x, y)=(*, 0)$. There are only four:

$$
(0,1), \quad(0,-1), \quad \text { and } \quad \text { (two points at infinity). }
$$

## Example

In 2006, Dujella discovered the elliptic curve

$$
E: \begin{aligned}
& Y^{2}+X Y=X^{3}-15343063417941874422081256126489574987160 X \\
&+486503741336910955243717595559583892156442731284430865537600
\end{aligned}
$$

with conductor

$$
\begin{aligned}
N_{E} & =17853766311199754524060290 \\
& =2 \cdot 3 \cdot 5 \cdot 7 \cdot 13 \cdot 17 \cdot 19 \cdot 23 \cdot 29 \cdot 31 \cdot 37 \cdot 41 \cdot 97 \cdot 313 \cdot 449 \cdot 47351
\end{aligned}
$$

has Mordell-Weil group $E(\mathbb{Q}) \simeq Z_{2} \times Z_{8} \times \mathbb{Z}^{3}$. Using the substitutions

$$
\begin{aligned}
& X=-\frac{6240(4083958238540477 x+37118233318627918)}{x-1} \\
& Y=\frac{1560}{(x-1)^{2}}\left(\begin{array}{l}
1960986248603425149997386795 y \\
+81679116477080954 x^{2} \\
+66068550160174882 x-74236466637255836
\end{array}\right)
\end{aligned}
$$

we see that it is birationally equivalent to the quartic curve with

$$
k=\frac{14435946721}{47594221921}=\frac{t^{4}-6 t^{2}+1}{\left(t^{2}+1\right)^{2}} \quad \text { where } \quad t=\frac{145}{444}
$$

## Can we do better than

$$
E(\mathbb{Q}) \simeq Z_{2} \times Z_{4} \times \mathbb{Z}^{8}
$$

## or

$$
E(\mathbb{Q}) \simeq Z_{2} \times Z_{8} \times \mathbb{Z}^{3} ?
$$

## Elliptic Surfaces

We will focus on the cases where the quartic curve
$E_{k}: y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right)$ has torsion subgroup $E_{k}(\mathbb{Q})_{\text {tors }} \simeq Z_{2} \times Z_{8}$.
We express our results in terms of elliptic surfaces.

Consider the affine curve

$$
C=\left\{t=(a: b) \in \mathbb{P}^{1} \mid a b\left(a^{4}-b^{4}\right)\left(a^{4}-6 a^{2} b^{2}+b^{4}\right) \neq 0\right\} .
$$

Fix the rational functions $A, B: C \rightarrow \mathbb{P}^{1}$ defined by

$$
\begin{aligned}
& A(t)=-27\left(k^{4}+14 k^{2}+1\right) \\
& B(t)=-54\left(k^{6}-33 k^{4}-33 k^{2}+1\right) \quad \text { where } \quad k=\frac{t^{4}-6 t^{2}+1}{\left(t^{2}+1\right)^{2}}
\end{aligned}
$$

and consider the surface
$\mathcal{E}=\left\{[(X: Y: Z), t] \in \mathbb{P}^{2} \times C \mid Y^{2} Z=X^{3}+A(t) X Z^{2}+B(t) Z^{3}\right\}$.

## Theorem (G-, 2008)

- With respect to $\mathcal{E} \rightarrow C$ which sends $[(X: Y: Z), t] \mapsto t$, the variety $\mathcal{E}$ is an elliptic surface. Each of the fibers $E_{t}$ is semistable.
- We have two sections

$$
\begin{aligned}
& P: t \mapsto\left[\left(12 \frac{t^{8}-4 t^{6}-26 t^{4}-4 t^{2}+1}{\left(t^{2}+1\right)^{4}}: 0: 1\right), t\right] \\
& Q: t \mapsto\left[\left(12 \frac{t^{8}-4 t^{6}-12 t^{5}-2 t^{4}+20 t^{2}+12 t+1}{\left(t^{2}+1\right)^{4}}: 864 \frac{t^{7}-5 t^{5}-4 t^{4}+3 t^{3}+4 t^{2}+t}{\left(t^{2}+1\right)^{5}}: 1\right), t\right]
\end{aligned}
$$

- All elliptic curves $E$ over a number field $K$ with torsion subgroup $\langle P(t), Q(t)\rangle \simeq Z_{2} \times Z_{8}$ arise from such a fiber, i.e., are birationally equivalent to $E_{t}$ for some $t \in C(K)$.
- The automorphisms $\sigma:(a: b) \mapsto(a-b: a+b)$ and $\tau:(a: b) \mapsto(-a: b)$ act on $C$, yet leave $A$ and $B$ invariant. Moreover, $D_{8}=\langle\sigma, \tau\rangle \hookrightarrow \operatorname{Aut}(C)$ is the dihedral group.

## Proposition (A. O. L. Atkin and François Morain, 1993)

- The elliptic curve $C_{1}: v^{2}=u^{3}-8 u-32$ has Mordell-Weil group $C_{1}(\mathbb{Q}) \simeq Z_{2} \times \mathbb{Z}$ as generated by $(u: v: 1)=(12: 40: 1)$.
- One can construct infinitely many fibers $E_{t}$ having positive rank via the map $C_{1} \rightarrow C$ defined by $(u: v: 1) \mapsto 2(u-9) /(3 u+v-2)$.

## Theorem (Garikai Campbell and G-, 2003)

- The elliptic curve $C_{2}: v^{2}=u^{3}-u^{2}-9 u+9$ has Mordell-Weil group $C_{2}(\mathbb{Q}) \simeq Z_{2} \times Z_{2} \times \mathbb{Z}$ as generated by $(u: v: 1)=(5: 8: 1)$.
- One can construct infinitely many fibers $E_{t}$ having positive rank via the map $C_{2} \rightarrow C$ defined by $(u: v: 1) \mapsto t=(u+v-3) /(2 u)$. Indeed, upon setting $w=3\left(u^{2}-2 u+4 v+9\right) /\left(u^{2}-18 u+9\right)$, we have a section

$$
\left.R: \quad(u: v: 1) \mapsto\left[\begin{array}{c}
\left(\frac{3\left(w^{2}-2 w-3\right)^{4}+12\left(w^{2}-w-3\right)\left(w^{2}+2 w-3\right)^{3}}{\left(w^{4}-2 w^{2}+9\right)^{2}}\right. \\
: \frac{54\left(w^{4}-9\right)\left(w^{2}-2 w-3\right)\left(w^{2}+2 w-3\right)^{3}}{\left(w^{4}-2 w^{2}+9\right)^{3}}: 1
\end{array}\right), \frac{u+v-3}{2 u}\right]
$$

## Infinite Families

There are infinitely many choices of rational $t$ such that

$$
E_{t}: y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right) \quad \text { where } \quad k=\frac{t^{4}-6 t^{2}+1}{\left(t^{2}+1\right)^{2}}
$$

has torsion subgroup $E_{t}(\mathbb{Q}) \simeq Z_{2} \times Z_{8}$ and rank $r \geq 1$. These choices of $t$ correspond to rational points on elliptic curves.

## Open Questions

- Are there other elliptic curves besides $C_{1}$ and $C_{2}$ which work?
- Is there a curve of genus 0 which gives $E_{t}$ having rank $r \geq 1$ ?
- Are there infinitely many rational $t$ which give $E_{t}$ having rank $r \geq 2$ ?

## Finding Curves of High Rank

## Approach \#1

Fix a square-free integer $D$, and consider the quadratic twist

$$
E^{(D)}: \quad Y^{2}=X^{3}+D^{2} A X+D^{3} B
$$

This is very efficient (i.e., no redundant curves), but $E^{(D)}(\mathbb{Q})_{\text {tors }}$ changes with each $D$.

## Approach \#2

Fix polynomials $A=A(t)$ and $B=B(t)$ such that $\Delta(t)=-16\left(4 A^{3}+27 B^{2}\right) \neq 0$, and consider the elliptic surface

$$
E_{t}: \quad Y^{2}=X^{3}+A(t) X+B(t)
$$

This is not very efficient (i.e., different $t$ 's may give the same curves), polynomials can be chosen to fix $E_{t}(\mathbb{Q})_{\text {tors }}$ for all $t$.

## Algorithm

\#1. Classify those elliptic curves $E$ over $\mathbb{Q}$ with torsion subgroup $E(\mathbb{Q})_{\text {tors }} \simeq Z_{2} \times Z_{8}$. Express these curves as an elliptic surface $E_{t}$.
\#2. Find a criterion on $t$ such that any $t \in \mathbb{Q}$ may be associated to an element from a fundamental region $\alpha<t<\beta$.
\#3. Create a list of candidate elliptic curves $E_{t}$ for this fundamental region.
\#4. Compute the 2-Selmer ranks to find upper bounds on the Mordell-Weil ranks.
\#5. Compute the Mordell-Weil ranks.

http://web.math.pmf.unizg.hr/~duje/tors/z2z8.html

## Fundamental Region

## Theorem (G-, 2006)

Fix a rational number $t \neq-1,0,1$ and consider

$$
E_{t}: \quad y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right) \quad \text { where } \quad k=\frac{t^{4}-6 t^{2}+1}{\left(t^{2}+1\right)^{2}} .
$$

- $D_{8}=\left\langle\sigma, \tau \mid \sigma^{4}=\tau^{2}=1, \tau \sigma \tau=\sigma^{-1}\right\rangle$ in terms of

$$
\sigma: t \mapsto \frac{t-1}{t+1} \quad \text { and } \quad \tau: t \mapsto-t .
$$

- We may assume that $t$ satisfies $0<t<\sqrt{2}-1$.

Remark: Given a bound $N$, choose coprime integers $a$ and $b$ satisfying

$$
0<(1+\sqrt{2}) a<b<N \quad \text { and set } \quad t=\frac{a}{b} .
$$

Define the curves and homogeneous spaces

$$
\begin{array}{ll}
E_{t}: y^{2}=\left(1-x^{2}\right)\left(1-k^{2} x^{2}\right) & \mathcal{C}_{d}: d w^{2}=\left(1-d z^{2}\right)\left(1-d k^{2} z^{2}\right) \\
E_{t}^{\prime}: y^{2}=\left(1-x^{2}\right)\left(1-\kappa^{\prime 2} x^{2}\right) & \mathcal{C}_{d}^{\prime}: d w^{2}=\left(1+d z^{2}\right)\left(1+d \kappa^{2} z^{2}\right) \\
E_{t}^{\prime \prime}: y^{2}=\left(1+x^{2}\right)\left(1+k^{\prime 2} x^{2}\right) & \mathcal{C}_{d}^{\prime \prime}: d w^{2}=\left(1+d z^{2}\right)\left(1+d k^{\prime 2} z^{2}\right)
\end{array}
$$

where

$$
\kappa=\frac{1-k}{1+k}, \quad \kappa^{\prime}=\frac{1-k^{\prime}}{1+k^{\prime}}, \quad \text { and } \quad k^{2}+k^{\prime 2}=1 .
$$

## Descent via 4-Isogeny

## Theorem (G-, 2006)

- There are 2-isogenies $\phi: E_{t} \rightarrow E_{t}^{\prime}$ and $\phi^{\prime}: E_{t}^{\prime} \rightarrow E_{t}^{\prime \prime}$.
- If $E \simeq E_{t}$ and $E^{\prime} \simeq E_{t}^{\prime}$, then $\left|\frac{E(\mathbb{Q})}{2 E(\mathbb{Q})}\right|=\left|\frac{E^{\prime}(\mathbb{Q})}{\phi(E(\mathbb{Q}))}\right|\left|\frac{E(\mathbb{Q})}{\hat{\phi}\left(E^{\prime}(\mathbb{Q})\right)}\right|$.
- Write $k=p / q$ for relatively prime integers $p$ and $q$. The image of $\delta_{\phi}$ (of $\delta_{\hat{\phi}}$, respectively) is the set of those square-free divisors $d$ of $p q$ (of $p^{2}-q^{2}$, respectively) such that $\mathcal{C}_{d}\left(\mathcal{C}_{d}^{\prime}\right.$, respectively) has a $\mathbb{Q}$-rational point.
- $\left(\delta_{\hat{\phi}} \circ \psi\right)(z, w) \equiv\left(\delta_{\phi} \circ \psi^{\prime}\right)(z, w) \equiv d \bmod \left(\mathbb{Q}^{\times}\right)^{2}$ for the maps

$$
\begin{array}{cl}
\psi: \mathcal{C}_{d}^{\prime} \rightarrow E_{t} & (z, w) \mapsto\left(\frac{1-d \kappa z^{2}}{1+d \kappa z^{2}}, \frac{4 d \kappa z w}{(1+\kappa)\left(1+d \kappa z^{2}\right)^{2}}\right) \\
\psi^{\prime}: \mathcal{C}_{d}^{\prime \prime} \rightarrow E_{t}^{\prime} & (z, w) \mapsto\left(\frac{1-d k^{\prime} z^{2}}{1+d k^{\prime} z^{2}}, \frac{4 d k^{\prime} z w}{\left(1+k^{\prime}\right)\left(1+d k^{\prime} z^{2}\right)^{2}}\right)
\end{array}
$$

## Example

## Proposition (Samuel Ivy, Brett Jefferson, Michele Josey, Cheryl Outing, Clifford Taylor, and Staci White, 2008)

When $t=9 / 296$ we have

$$
\langle-1,6477590,2,7\rangle \subseteq \delta_{\hat{\phi}} \subseteq\langle-1,6477590,2,7,37\rangle
$$

Hence $E_{t}$ has Mordell-Weil group $E_{t}(\mathbb{Q}) \simeq Z_{2} \times Z_{8} \times \mathbb{Z}^{3}$ if and only if at least one of the following homogeneous spaces corresponding to $d=37$ contains a rational point $(z, w)$ :

$$
\begin{aligned}
\mathcal{C}_{37}^{\prime}: w^{2} & =2172344348297474273125 z^{4} \\
& +58712815268370607681 z^{2}+21779862847488 \\
\mathcal{C}_{37}^{\prime \prime}: w^{2} & =2188470374735494973797 z^{4} \\
& +60017913360731350081 z^{2}+23515280943436800 .
\end{aligned}
$$

## Challenge Problem Revisited

$$
E: y^{2}=x^{3}+(5-\sqrt{5}) x^{2}+\sqrt{5} x
$$

- The curve has invariant $j(E)=86048-38496 \sqrt{5}$.
- The curve has conductor $\mathfrak{f}_{E}=\mathfrak{p}_{2}^{6} \mathfrak{p}_{5}^{2}$ in terms of the prime ideals $\mathfrak{p}_{2}=2 \mathbb{Z}[\varphi]$ and $\mathfrak{p}_{5}=\sqrt{5} \mathbb{Z}[\varphi]$, where $\varphi=\frac{1+\sqrt{5}}{2}$.
- This curve is 2 -isogeneous to (a quadratic twist of) its Galois conjugate.

## Theorem (G-, 1999)

The elliptic curve $E$ is modular. More precisely, there is a modular form $f(q) \in S_{2}\left(\Gamma_{0}(160), \epsilon\right)$ and a Dirichlet character $\chi: \mathbb{Z}[\varphi] \rightarrow \mathbb{C}$ such that $\chi^{2}=\epsilon \circ \mathbb{N}_{\mathbb{Q}(\sqrt{5}) / \mathbb{Q}}$ and $a_{\mathfrak{p}}(f)=\chi(\mathfrak{p}) a_{\mathfrak{p}}(E)$ for almost all primes $\mathfrak{p}$.

## Question

Did you compute the Mordell-Weil group $E(\mathbb{Q}(\sqrt{5}))$ ?
