numerical algebraic geometry

Introduced in 1995 as a pun on numerical linear algebra.

In numerical algebraic geometry, we apply homotopy continuation to compute positive dimensional solutions of polynomial systems.

Four homotopies compute a numerical irreducible decomposition:

- Cascade homotopies compute generic points on all solution components, over all dimensions.
- A homotopy membership test decides whether a given point belongs to a component of the solution set.
- Monodromy loops factor pure dimensional solution sets into irreducible components.
- A diagonal homotopy intersects solution sets.
- The data structure to represent a solution set is a witness set:
 - a polynomial system augmented with random linear equations;
 - Solutions of the augmented system are generic points.

in the cloud

www.phcpack.org provides access to a Jupyter notebook (alternative site: https://pascal.math.uic.edu) with a SageMath 8.0 kernel, where phcpy is installed.

Code snippets are defined via Jupyter's notebook extensions:

- each snippet illustrates a particular feature of phcpy; and
- each snippet runs independently.

Users have actual accounts on the server:

- a terminal window to a Linux computer.
- Facilitates collaborations, sharing notebooks and data.

witness sets

To compute the degree of the twisted cubic, consider

$$\mathcal{E}(\mathbf{f})(\mathbf{x}) = \left\{egin{array}{c} x_2 - x_1^2 = 0 \ x_3 - x_1^3 = 0 \ c_0, c_1, c_2, c_3 \in \mathbb{C}, \ c_0 + c_1 x_1 + c_2 x_2 + c_3 x_3 = 0 \end{array}
ight.$$

where c_0 , c_1 , c_2 , and c_3 are random numbers. The substitution $x_2 = x_1^2$ and $x_3 = x_1^3$ in the last equation shows that the degree of $\mathbf{f}^{-1}(\mathbf{0})$ equals three.

A witness set for a k-dimensional solution set consists of

- k hyperplanes with random coefficients; and
- the set of *d* isolated solutions on those hyperplanes.

Because the hyperplanes are random, all d isolated solutions are generic points and d is the degree of the set.

A D N A B N A B N A B N

an example

Consider the system

$$\mathbf{f}(\mathbf{x}) = \begin{cases} (x_1^2 - x_2)(x_1 - 0.5) = 0\\ (x_1^3 - x_3)(x_2 - 0.5) = 0\\ (x_1 x_2 - x_3)(x_3 - 0.5) = 0 \end{cases}$$

The solutions of the system $\mathbf{f}(\mathbf{x}) = \mathbf{0}$ are

- the twisted cubic, a one dimensional solution set; and
- four isolated points.

Can we compute all solutions with one homotopy?

- A TE N - A TE N

a cascade homotopy

To compute numerical representations of the twisted cubic and the four isolated points, use

$$\mathbf{h}(\mathbf{x}, z_1, t) = \begin{bmatrix} (x_1^2 - x_2)(x_1 - 0.5) \\ (x_1^3 - x_3)(x_2 - 0.5) \\ (x_1 x_2 - x_3)(x_3 - 0.5) \end{bmatrix} + t \begin{bmatrix} \gamma_1 \\ \gamma_2 \\ \gamma_3 \end{bmatrix} z_1 \\ t (c_0 + c_1 x_1 + c_2 x_2 + c_3 x_3) + z_1 \end{bmatrix} = \mathbf{0}.$$

At t = 1: $h(x, z_1, t) = \mathcal{E}_1(f)(x, z_1) = 0$.

At t = 0: $h(x, z_1, t) = f(x) = 0$.

As *t* goes from 1 to 0, the hyperplane is removed from the embedded system, and z_1 is forced to zero.

イロト イポト イラト イラト

a superwitness set cascade

Summarizing the progress of the path tracking:

Starting with 13 paths of the embedded system, the cascade produces three witness points for the cubic and 9 points which may be isolated or lie on the cubic.

A D N A B N A B N A B

regularity results

Theorem (superwitness set generation)

For an embedding $\mathcal{E}_i(\mathbf{f})(\mathbf{x}, \mathbf{z})$ of $\mathbf{f}(\mathbf{x}) = \mathbf{0}$ with *i* random hyperplanes and *i* slack variables $\mathbf{z} = (z_1, z_2, \dots, z_i)$, we have

- solutions with z = 0 contain deg W generic points on every i-dimensional component W of f(x) = 0;
- **2** solutions with $\mathbf{z} \neq \mathbf{0}$ are regular; and
- the solution paths defined by the cascading homotopy starting at t = 0 with all solutions with z_i ≠ 0 reach at t = 1 all isolated solutions of E_{i-1}(f)(x, z) = 0.

an algorithm

Input: $f(\mathbf{x}) = \mathbf{0}$ a polynomial system; d the top dimension of $f^{-1}(\mathbf{0})$. Output: $\widehat{W} = [\widehat{W}_d, \widehat{W}_{d-1}, \dots, \widehat{W}_0]$ super witness sets for all dimensions. $V := \text{Solve}(\mathcal{E}_d(\mathbf{f})(\mathbf{x}, \mathbf{z}) = \mathbf{0});$ for k from d down to 1 do $\widehat{W}_k := \{ (\mathbf{x}, \mathbf{z}) \in V \mid \mathbf{z} = \mathbf{0} \};$ $V := \{ (\mathbf{x}, \mathbf{z}) \in V \mid z_k \neq 0 \};$ if $V = \emptyset$ then return \widehat{W} : else $\mathbf{h}(\mathbf{x}, \mathbf{z}, t) := (1 - t)\mathcal{E}_k(\mathbf{f})(\mathbf{x}, \mathbf{z}) + t \begin{pmatrix} \mathcal{E}_{k-1}(\mathbf{f})(\mathbf{x}, \mathbf{z}) \\ Z_k \end{pmatrix};$ $V := \{ (\mathbf{x}, \mathbf{z}) \mid \mathbf{h}(\mathbf{x}, \mathbf{z}, 1) = \mathbf{0} \};$ end if: end for;

$$\widehat{W}_{\mathbf{0}} := \{ (\mathbf{x}, \mathbf{z}) \in V \mid \mathbf{z} = \mathbf{0} \}.$$

A (10) A (10)

deciding membership

Given a witness set representation for a solution set, we can decide whether a point belongs to the solution set, via:

Algorithm HomotopyMembershipTest(*W*_L,**y**)

Input: W_L is witness set for a solution set;

y is any point in space.

Output: yes or no, depending whether y belongs to the set.

$$\begin{aligned} \mathbf{h}(\mathbf{x},t) &= (1-t) \begin{pmatrix} \mathbf{f}(\mathbf{x}) = \mathbf{0} \\ L(\mathbf{x}) = \mathbf{0} \end{pmatrix} + t \begin{pmatrix} \mathbf{f}(\mathbf{x}) = \mathbf{0} \\ L(\mathbf{x}) = L(\mathbf{y}) \end{pmatrix} = \mathbf{0}; \\ V &:= \{ \mathbf{x} \mid \mathbf{h}(\mathbf{x},1) = \mathbf{0} \}; \\ \text{return } \mathbf{y} \in V. \end{aligned}$$

イロト イポト イラト イラト

schematic membership

A curve V is represented by 3 witness points on L:

To decide whether $\mathbf{y} \in V$, we create a new witness set for a line $L_{\mathbf{y}}$ through \mathbf{y} .

As $\mathbf{y} \notin V \cap L_{\mathbf{y}}$, we conclude $\mathbf{y} \notin V$.

4 3 5 4 3

the linear trace

Consider $f \in \mathbb{C}[x, y]$, deg(f) = 3. Does f factor?

Assume *f* has a quadratic factor *q*.

We view $f \in \mathbb{C}[x][y]$ and write q as

$$\begin{array}{lll} q(x,y(x)) &=& (y-y_1(x))(y-y_2(x)) \\ &=& y^2-(y_1(x)+y_2(x))y+y_1(x)y_2(x). \end{array}$$

Observe: if *q* is a quadratic factor of *f*, then $y_1(x) + y_2(x)$ must be a linear function of *x*, otherwise the degree of *q* would be higher than two.

Denote $t_1(x) = y_1(x) + y_2(x)$ and call t_1 the linear trace.

(I) > (A) > (A) > (A) > (A)

interpolating the linear trace

Fix $x = x_1$ and solve $f(x_1, y) = 0$ for y.

As deg(f) = 3, we find three roots and write them as as $(x_1, y_1(x^*))$, $(x_1, y_2(x^*))$, and $(x_1, y_3(x^*))$.

If *f* has a quadratic factor *q*, its linear trace t_1 is $t_1(x) = y_1(x) + y_2(x) = ax + b$, for some $a, b \in \mathbb{C}$.

Take $x_2 \neq x_1$ and consider

$$\begin{cases} ax_1 + b = y_1(x_1) + y_2(x_1) \\ ax_2 + b = y_1(x_2) + y_2(x_2) \end{cases}$$

Solving the linear system for *a* and *b* determines $t_1(x)$.

Take a third sample set, at $x = x_3$ and test

$$t(x_3) = ax_3 + b \stackrel{?}{=} y_1(x_3) + y_2(x_3).$$

・ロト ・ 同ト ・ ヨト ・ ヨト … ヨ

an example

Use $\{(x_0, y_{00}), (x_0, y_{01}), (x_0, y_{02})\}$ and $\{(x_1, y_{10}), (x_1, y_{11}), (x_1, y_{12})\}$ to find $t_1(x) = c_0 + c_1 x$. At $\{(x_2, y_{20}), (x_2, y_{21}), (x_2, y_{22})\}$: $c_0 + c_1 x_2 = y_{20} + y_{21} + y_{22}$?

combinatorial enumeration

A linear trace test answers each question:

This combinatorial enumeration works for low degrees, and is improved via LLL to solve the knapsack problem.

avoiding wrong factorizations

Consider $f(x, y) = (x^2 + y^2)^3 - 4x^2y^2 = 0$. By symmetry: if f(a, b) = 0, then also $f(\pm a, \pm b) = 0$.

Pictures of f(x, y) = 0 and $f(x + \frac{1}{2}y, y) = 0$:

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

factoring witness sets

Consider
$$\left\{ \begin{array}{c} f(x,y)=0\\ c_0+c_1x+c_2y=0 \end{array}
ight.$$
 for random $c_0,\,c_1,\, ext{and}\,c_2.$

To sample points, we apply the coordinate transformation:

$$\phi: \mathbb{C}^2 \to \mathbb{C}^2: \begin{bmatrix} x \\ y \end{bmatrix} \mapsto \phi(x, y) = \begin{bmatrix} -c_1 & -c_2 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

As the samples satisfy the equation $c_0 + c_1x + c_2y = 0$, we have $\phi(x, y) = (c_0, y)$.

The coordinate transformation applies in any dimension.

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

$z^3 - w = 0$ as a Riemann surface

イロト イヨト イヨト イヨト

monodromy loops

Moving between witness sets:

$$\mathbf{h}_{\mathcal{K}\!L}(\mathbf{x},t) = \lambda \left(\begin{array}{c} \mathbf{f}(\mathbf{x}) \\ \mathcal{K}(\mathbf{x}) \end{array}\right) (\mathbf{1}-t) + \left(\begin{array}{c} \mathbf{f}(\mathbf{x}) \\ \mathcal{L}(\mathbf{x}) \end{array}\right) t = \mathbf{0}, \quad \lambda \in \mathbb{C},$$

we find new witness points on the hyperplanes $K(\mathbf{x}) = \mathbf{0}$, starting at those witness points satisfying $L(\mathbf{x}) = \mathbf{0}$, letting *t* move from one to zero.

Choosing a random $\mu \neq \lambda$, we move back from *K* to *L*:

$$\mathbf{h}_{\mathcal{LK}}(\mathbf{x},t) = \mu \left(\begin{array}{c} \mathbf{f}(\mathbf{x}) \\ \mathcal{L}(\mathbf{x}) \end{array}\right) (\mathbf{1}-t) + \left(\begin{array}{c} \mathbf{f}(\mathbf{x}) \\ \mathcal{K}(\mathbf{x}) \end{array}\right) t = \mathbf{0}, \quad \mu \in \mathbb{C}.$$

After \mathbf{h}_{KL} and \mathbf{h}_{LK} we arrive at the same witness set. Permuted points belong to the same irreducible component.

monodromy breakup algorithm

Input: W_L, d, N

Output: \mathcal{P}

- 0. initialize \mathcal{P} with d singletons;
- 1. generate two slices L' and L'' parallel to the given L;

sign up and login, at www.phcpack.org

The sign up procedure requires a functional email address.

Two steps in obtaining an account:

- Visit www.phcpack.org and fill out a form. www.phcpack.org redirects to https://pascal.math.uic.edu.
- Olick on the link sent in the email to your email address.

Two kernels offer phcpy, do import phcpy in both:

- python 2 (the code snippets work for version 2 of python).
- SageMath uses python 2 as the scripting language.

Select the kernel from the new menu in the upper right.
