# Regular Expressions

using the `re` module

MCS 275 L-41

25 April 2008

Manipulating text and strings is an important task:

- ▶ parse to ensure entered data is correct,
- ▶ search through confidential data: use program.

Suppose `answer` contains the answers to a yes or no question.

Acceptable yes answers:

1. `y` or `yes`
2. `Y` or `Yes`

Testing all these cases is tedious.

Support for regular expressions:

```
>>> import re
```

`re` is a standard library module.

Pattern Matching

# Matching Strings with `match()`

creating match objects

MCS 275 L-41

25 April 2008

The function `match()` in the `re` module:

```
>>> re.match( < pattern > , < string > )
```

If the `string` does not match the `pattern`,  
then `None` is returned.

If the `string` matches the `pattern`,  
then a match object is returned.

```
>>> re.match('he','hello')  
<_sre.SRE_Match object at 0x5cb10>  
>>> re.match('hi','hello') == None  
True
```

using the `re` module  
matching strings with  
`match()`

Regular  
Expressions

common regular expression  
symbols  
groups of regular  
expressions

The Meaning of  
Python

a dynamic language  
rapid application  
development

What can we do with the match object?

```
>>> re.match('he','hello')
<_sre.SRE_Match object at 0x5cb10>
>>> _.group()
'he'
```

After a successful match, `group()` returns  
that part of the pattern that matches the string.

# The `group()` Method

using a match object

MCS 275 L-41

25 April 2008

## Pattern Matching

using the `re` module  
matching strings with  
`match()`

## Regular Expressions

common regular expression  
symbols  
groups of regular  
expressions

## The Meaning of Python

a dynamic language  
rapid application

What can we do with the match object?

```
>>> re.match('he','hello')
<_sre.SRE_Match object at 0x5cb10>
>>> _.group()
'he'
```

After a successful match, `group()` returns that part of the pattern that matches the string.

# Searching versus Matching

the methods `search()` and `match()`

The match only works from the start:

```
>>> re.match('ell','hello') == None
True
```

Looking for the first occurrence of the pattern  
in the string, with `search()`:

```
>>> re.search('ell','hello')
<_sre.SRE_Match object at 0x5cb10>
>>> _.group()
'ell'
```

## Pattern Matching

using the `re` module

# the `groups()` method

MCS 275 L-41

25 April 2008

Groups of regular expressions are designated with parenthesis, between `(` and `)`.

Syntax:

```
< pattern > = ( < group1 > ) ( < group2 > )  
m = re.match( < pattern > , < string > )  
if m != None: m.groups()
```

After a successful match, `groups()` returns a tuple of those parts of the string that matched the pattern.

Pattern Matching

using the `re` module  
matching strings with  
`match()`

# The Development Cycle

compilation versus interpretation

MCS 275 L-41

25 April 2008

Traditional build cycle:

1. run the application
2. test the behavior of the code
3. stop the application
4. edit the program code
5. recompile the code
6. relink executable
7. goto step 1

This is the static language build cycle.

Python eliminates steps 4 and 5.

Recompilation and relinking is not a trivial task for systems with over 100,000 lines of code.

# Sinking the Titanic

the iceberg that sank so many large software projects...

The Titanic refers to the iceberg. What we see is the exposed interface (the domain of Python), what is hidden are the system internals (the domain of C/C++).

"Python provides a simple but powerful rapid development language, *along with the integration tools to apply it in realistic development environments.*"

Mark Lutz, page 1195

The idea of integration is not new,  
but the innovation is in providing the tools.

Python is open source and cross platform.

We ended with yet another module, useful for parsing.  
Assignments:

1. Phone numbers may start with a three digit area code followed by seven numbers. Give a pattern to accept 7 or 10 digit numbers. Group the pattern so the area code may be extracted with `groups()`.
2. A safe password should contain at least one digit and at least one alphanumeric character. The digit and the alphanumeric character may occur anywhere in the password. Write a pattern for this requirement.
