## Calculus 140, section 3.7 Related Rates

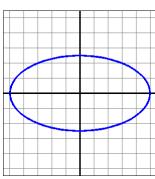

notes by Tim Pilachowski

In section 3.6 we considered equations (which may or may not have been functions) relating two variables x and y and used implicit differentiation to find  $\frac{dy}{dx}$ .

This section takes the process of implicit differentiation and applies it in a new context. We'll once again have equations relating *x* and *y*, but instead of finding the rate at which *x* and *y* are changing with respect to each other, we'll be finding the rate of change of each with respect to a third variable, *t* (almost always representing time.

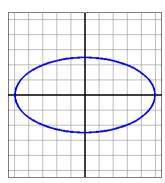

Example A-1: A go-kart track is in the shape of an ellipse with equation  $x^2 + 4y^2 = 2500$ . Go-karts travel counterclockwise around the track, starting at point (50,0). At the end of the first lap [i.e. at the point (50,0) again] Rodna's go-kart is going 10 mph [i.e.  $\frac{dy}{dt} = 10$ ]. How is her x-coordinate

changing [i.e. what is the value of  $\frac{dx}{dt}$ ]? answer:  $\approx 0$  mph

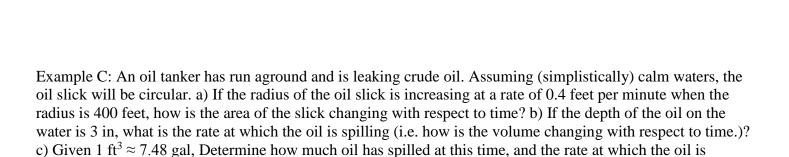

Example A-2: A go-kart track is in the shape of an ellipse with equation  $x^2 + 4y^2 = 2500$ . Lewce passes Rodna at the point (30,20). At that moment, Lewce's y-velocity is 6 mph [i.e.  $\frac{dy}{dt} = 6$ ]. How is his x-coordinate

changing [i.e. what is the value of  $\frac{dx}{dt}$ ]? answer:  $\approx -16$  mph

Example B (a classic application): A 24-foot extension ladder is leaning against the side of the house, and I'm standing on a rung 1 ft from the top of the ladder so I can wash windows on the second floor. My brother was supposed to be holding the bottom, but got distracted by the ice-cream truck. When he walked away, the bottom of the ladder was 10 ft away from the house. At the time the bottom of the ladder reaches 15 ft away from the house it was slipping at a rate of 2 ft per second. How fast am I (near the top of the ladder) dropping toward the ground? answer:  $\approx -1.72$  ft/s

leaking in gallons per minute. answers:  $\approx 1005 \text{ ft}^2$ ;  $\approx 251 \text{ ft}^3$ ;  $\approx 939,965 \text{ gal}$ ,  $\approx 1644.9 \text{ gal/min}$
